Abstract.

The graded Hecke algebra for a finite Weyl group is intimately related to the geometry of
the Springer correspondence. A construction of Drinfeld produces an analogue of a graded Hecke
algebra for any finite subgroup of $GL(V)$. This paper classifies all the algebras obtained by ap-
plying Drinfeld's construction to complex reflection groups. By giving explicit (though nontrivial)
isomorphisms, we show that the graded Hecke algebras for finite real reflection groups constructed
by Lusztig are all isomorphic to algebras obtained by Drinfeld's construction. The classification
shows that there exist algebras obtained from Drinfeld's construction which are not graded Hecke
algebras as defined by Lusztig for real as well as complex reflection groups.

0. Introduction

This paper is motivated by a general effort to generalize the theory of Weyl groups and their
relation to groups of Lie type to the setting of complex reflection groups. One natural question is
whether there are affine Hecke algebras corresponding to complex reflection groups. If they exist
then it might be possible to use these algebras to build an analogue of the Springer correspondence
for complex reflection groups.

A priori, one knows how to construct affine Hecke algebras only corresponding to Weyl groups
since both a finite real reflection group $W$ and a $W$-invariant lattice (the existence of which forces
$W$ to be a Weyl group) are needed in the construction. Our search for analogues of graded
Hecke algebras for complex reflection groups was motivated by Lusztig's results [Lu2] showing
that the geometric information contained in the affine Hecke algebra can be recovered from the

Keywords: reflection group, Coxeter group, Weyl group, affine Hecke algebra, Iwahori-Hecke algebra, representation
theory, graded Hecke algebra.
corresponding graded Hecke algebra. Lusztig [Lu] defines the graded Hecke algebra for a finite Weyl group \( W \) with reflection representation \( V \). Let \( t_g, g \in W \), be a basis for the group algebra \( CW \) of \( W \) and let \( k_\alpha \in \mathbb{C} \) be "parameters" indexed by the roots in the root system of \( W \) such that \( k_\alpha \) depends only on the length of the root \( \alpha \). Then the graded Hecke algebra \( H_{gr} \) depending on the parameters \( k_\alpha \) is the (unique) algebra structure on \( S(V) \otimes CW \) such that

(a) the symmetric algebra of \( V \), \( S(V) = S(V) \otimes 1 \), is a subalgebra of \( H_{gr} \),
(b) the group algebra \( CW = 1 \otimes CW = \text{span}\{1 \otimes t_g \mid g \in W\} \) is a subalgebra of \( H_{gr} \), and
(c) \( t_{s_i}v = (s_i v)_{s_i} - k_{\alpha_i} \langle v, \alpha_i^\vee \rangle \), for all \( v \in V \) and simple reflections \( s_i \) in the simple roots \( \alpha_i \).

This definition applies to all finite real reflection groups \( W \) since the simple roots and simple reflections are well defined. Unfortunately, the need for simple reflections in the construction makes it unclear how to define analogues for complex reflection groups.

For finite real reflection groups, the graded Hecke algebra \( H_{gr} \) is a "semdirect product" of the polynomial ring \( S(V) \) and the group algebra \( CW \). Drinfeld [Dr] defines a different type of semidirect product of \( S(V) \) and \( CW \), and Drinfeld's construction applies to all finite subgroups \( G \) of \( GL(V) \). In this paper, we

(1) Classify all the algebras obtained by applying Drinfeld's construction to finite complex reflection groups \( G \),

(2) Show that every graded Hecke algebra \( H_{gr} \) (as defined by Lusztig) for a finite real reflection group is isomorphic to an algebra obtained by Drinfeld's construction by giving explicit isomorphisms between these algebras.

The results from (2) show how Drinfeld's construction is a true generalization of Lusztig's construction of graded Hecke algebras, something which is not obvious. Our classification in (1) gives a complete solution to the problem of finding all graded Hecke algebras for finite reflection groups.

A consequence of our classification is that there exist graded Hecke algebras for finite real reflection groups which are not obtained with Lusztig's construction. In this sense, Drinfeld's construction is a strict generalization of the algebras \( H_{gr} \). These new algebras, and the algebras corresponding to complex reflection groups that are not real reflection groups, deserve further study and probably have interesting representation theories.

For us, one surprising result of our classification is that no nontrivial graded Hecke algebra structures exist for many complex reflection groups. In some sense, this is disappointing, as we would have liked to find nontrivial and interesting structures for each complex reflection group.

It might be that we have not yet hit upon the "right" definition of graded Hecke algebras. For example, we show that there do not exist nontrivial graded Hecke algebra structures, according to Drinfeld's definition, for any of the complex reflection groups \( G(r, 1, n) = (\mathbb{Z}/r\mathbb{Z}) \wr S_n \) when \( r > 2 \) and \( n > 3 \). On the other hand, in the last section of this paper we are able to construct algebras that "look" like they ought to be graded Hecke algebras corresponding to these groups. Is it possible that there is a "better" definition of graded Hecke algebras which applies to complex reflection groups and which includes the algebras that we introduce in Section 5 as examples?

Acknowledgements. We thank C. Kriloff for numerous stimulating conversations during our work on this paper. A. 1. Graded Hecke algebras

In this section, we define the graded Hecke algebra following Drinfeld [Dr]. Our main result in this section is Theorem 1.9c, which determines exactly how many degrees of freedom one has in defining a graded Hecke algebra.
Let \( V \) be an \( n \) dimensional vector space over \( \mathbb{C} \) and let \( G \) be a finite subgroup of \( GL(V) \). The group algebra of \( G \) is

\[ CG = \mathbb{C}\text{-span}\{t_g \mid g \in G\}, \quad \text{with} \quad t_g t_h = t_{gh}. \]

Let \( a_g: V \times V \to \mathbb{C} \) be skew symmetric bilinear forms indexed by the elements of \( G \) and let \( A \) be the associative algebra generated by \( V \) and \( CG \) with the additional relations

\[ t_h v t_{h^{-1}} = hv \quad \text{and} \quad [v, w] = \sum_{g \in G} a_g(v, w) t_g, \quad \text{for } h \in G \text{ and } v, w \in V, \tag{1.1} \]

where \( [v, w] = vw - wv \). These relations allow every element \( a \in A \) to be written in the form

\[ a = \sum_{g \in G} p_g t_g, \quad p_g \in S(V), \tag{1.2} \]

where \( S(V) \) is the symmetric algebra of \( V \). More precisely, one must fix a section of the canonical surjection \( T(V) \to S(V) \) from the tensor algebra of \( V \) to \( S(V) \) and take the elements \( p_g \) to be in the image of this section.

The structure of \( A \) depends on the choices of the "parameters" \( a_g(v, w) \in \mathbb{C} \). Our goal is to determine when the algebra \( A \) will be a "semidirect product" of \( S(V) \) and \( CG \). This idea motivates the following definition [Dr].

The algebra \( A \) is a graded Hecke algebra for \( G \) if

\[ A \cong S(V) \otimes CG \quad \text{as a vector space}, \]

or, equivalently, if the expression in (1.2) is unique for each \( a \in A \). A general element \( a \in A \) is a linear combination of products of elements \( t_g \) and \( u_i \), where \( \{u_1, u_2, \ldots, u_n\} \) is a basis of \( V \). There are two straightening operations needed to put \( a \) in the form (1.2):

(a) moving \( t_h \)'s to the right, and (b) putting \( u_i u_j \) pairs in the correct order.

These two straightening operations correspond to the two identities in (1.1). Note that the "correct order" of \( u_i u_j \) is determined by the choice of the section of the projection \( T(V) \to S(V) \). Let \( v_1, v_2, v_3 \) be arbitrary elements of \( V \) and let \( h \in G \). Applying the straightening operations to \( t_h v_1 v_2 \) gives

\[ t_h v_1 v_2 = t_h [v_1, v_2] + t_h v_2 v_1 \]
\[ = t_h [v_1, v_2] + (hv_2)(hv_1)t_h \]

(rearrange \( v_1 \) and \( v_2 \))

(move \( t_h \) to the right),

and applying the straightening operations in a different order gives

\[ t_h v_1 v_2 = (hv_1)(hv_2)t_h \]
\[ = [hv_1, hv_2]t_h + (hv_2)(hv_1)t_h. \]

(move \( t_h \) to the right)

Setting these two expressions equal gives the relation

\[ t_h [v_1, v_2] t_{h^{-1}} = [hv_1, hv_2], \quad \text{for all } h \in G, v_1, v_2 \in V. \tag{1.3} \]
Similarly, applying the straightening operations to \(v_1v_2v_3\) gives

\[
v_1v_2v_3 = [v_1, v_2]v_3 + v_2v_1v_3 \quad \text{(moving } v_1 \text{ past } v_2) \\
= [v_1, v_2]v_3 + v_2[v_1, v_3] + v_2v_3v_1 \quad \text{(moving } v_1 \text{ past } v_3) \\
= [v_1, v_2]v_3 + v_2[v_1, v_3] + [v_2, v_3]v_1 + v_3v_2v_1 \quad \text{(straightening } v_2 \text{ and } v_3),
\]

and applying the straightening operations in a different order gives

\[
v_1v_2v_3 = v_1[v_2, v_3] + v_3v_1v_2 \quad \text{(moving } v_2 \text{ past } v_3) \\
= v_1[v_2, v_3] + [v_1, v_3]v_2 + v_3v_1v_2 \quad \text{(moving } v_1 \text{ past } v_3) \\
= v_1[v_2, v_3] + [v_1, v_3]v_2 + [v_3, [v_1, v_2]] + v_3v_2v_1 \quad \text{(straightening } v_1 \text{ and } v_2).
\]

These are equal if

\[
[v_1, [v_2, v_3]] + [v_2, [v_3, v_1]] + [v_3, [v_1, v_2]] = 0, \quad \text{for all } v_1, v_2, v_3 \in V. \tag{1.4}
\]

Conversely, the identities (1.3) and (1.4) are exactly what is needed to guarantee that any order of application of the straightening operations (a) and (b) will produce the same normal form (1.2) for the element \(a\). Thus we have

**Lemma 1.5.** Let \(A\) be an algebra defined as in (1.1). Then \(A\) is a graded Hecke algebra if and only if the identities (1.3) and (1.4) hold in \(A\).

Using (1.1), the relations (1.3) and (1.4) can be rewritten in terms of the bilinear forms \(a_g: V \times V \to \mathbb{C}\) as

\[
a_g(v_1, v_2) = a_{hg^{-1}}(hv_1, hv_2) \quad \text{and} \\
a_g(v_3, v_1)(gv_2 - v_2) + a_g(v_2, v_3)(gv_1 - v_1) + a_g(v_1, v_2)(gv_3 - v_3) = 0
\]

for \(v_1, v_2, v_3 \in V\) and \(g, h \in G\).

Let \((\cdot, \cdot): V \times V \to \mathbb{C}\) be a \(G\)-invariant nondegenerate Hermitian form on \(V\). For each \(g \in G\), set

\[
V^g = \{v \in V \mid gv = v\}, \\
(V^g)^\perp = \{v \in V \mid (v, w) = 0 \text{ for all } w \in V^g\}, \quad \text{and} \\
\ker a_g = \{v \in V \mid a_g(v, w) = 0 \text{ for all } w \in V\}.
\]

**Lemma 1.8.** Let \(G\) be a finite subgroup of \(GL(V)\) and let \(g \in G\).

(a) \((V^g)^\perp = \{v - gv \mid v \in V\}\).

(b) Suppose \(g \neq 1\). If \(\text{codim}(V^g) = 2\) and \(a: V \times V \to \mathbb{C}\) is a skew symmetric bilinear form such that \(\ker a = V^g\), then \(a\) satisfies (1.7).

Let \(A\) be a graded Hecke algebra for \(G\) defined by skew symmetric bilinear forms \(a_g: V \times V \to \mathbb{C}\). (c) If \(g \neq 1\) then \(\ker a_g \supseteq V^g\).

(d) If \(g \neq 1\) and \(a_g \neq 0\) then \(\ker a_g = V^g\) and \(\text{codim}(V^g) = 2\).

(e) If \(g \neq 1\) and \(a_g \neq 0\) then, for all \(h \in G\),

\[
a_{h^{-1}gh}(b_1, b_2) = \det(h^\perp)a_g(b_1, b_2),
\]

where \(\{b_1, b_2\}\) is a basis of \((V^g)^\perp\) and \(h^\perp: (V^g)^\perp \to (V^g)^\perp\) is the composition of \(h\) restricted to \((V^g)^\perp\) with the canonical projection \(V \to V/V^g\).
Proof. (a) Consider the map \( \phi: V \to V \) given by \( \phi(v) = v - gv \). Then \( \ker \phi = V^g \) and \( \text{im} \phi \subseteq (V^g)^\perp \) since, if \( v \in V, w \in V^g \), then
\[
(v - gw, w) = (v, w) - (gw, w) = (v, w) = (gw, gw) = (v, w) - (v, w).
\]
Since \( \dim(\text{im} \phi) = \text{codim}(\ker \phi) = \text{codim}(V^g) \) it follows that \( \text{im} \phi = (V^g)^\perp \).

(b) Let \( v_1, v_2, v_3 \in V \). If any \( v_i \in V^g \), then (1.7) holds trivially for the skew symmetric form \( a \). So assume each \( v_i \notin V^g \) and write each \( v_i \) as \( v_i^+ + v_i^- \) where \( v_i^+ \in V^g \) and \( v_i^- \in (V^g)^\perp \). Then
\[
a(v_i, v_j) = a(v_i^-, v_j^-) \quad \text{and} \quad v_i = gv_i = v_i^- - gv_i^-.
\]
Since \( \dim(V^g)^\perp = 2 \), at least one of the \( v_i^- \) is a linear combination of the other two. Say \( v_i^- = c_2v_2^- + c_3v_3^- \) with \( c_2, c_3 \in \mathbb{C} \). Substituting \( v_i - gv_i = v_i^- - gv_i^- \) and \( v_i^- = c_2v_2^- + c_3v_3^- \) then yields
\[
a(v_3, v_1)(gv_2 - v_2) + a(v_2, v_3)(gv_1 - v_1) + a(v_1, v_2)(gv_3 - v_3)
\]
\[
= a(v_3^-, v_1^-)(gv_2^- - v_2^-) + a(v_2^-, v_3^-)(gv_1^- - v_1^-) + a(v_1^-, v_2^-)(gv_3^- - v_3^-) = 0,
\]
and so (1.7) holds.

(c) Let \( v_3 \in V^g \) and \( v_2 \in V \).

If \( v_2 \notin V^g \), then \( a_g(v_2, v_3)(gv_1 - v_1) = 0 \) for all \( v_1 \in V \) by (1.7). Since \( V^g \neq V \), there is some \( v_1 \) such that \( gv_1 \neq v_1 \) and so \( a_g(v_2, v_3) = 0 \).

If \( v_2 \notin V^g \), let \( v_1 = \sum_{k=1}^{r-1} g^kv_2 \), where \( r \) is the order of \( g \). By (1.6), \( a_g(v_3, g^kv_2) = a_g(g^{-k}v_3, v_2) = a_g(v_3, v_2) \), for any \( k \), and so
\[
0 = a_g(v_3, v_1)(gv_2 - v_2) + a_g(v_2, v_3)(gv_1 - v_1)
\]
\[
= (r - 1)a_g(v_3, v_2)(gv_2 - v_2) + a_g(v_3, v_2)(gv_2 - v_2) = ra_g(v_3, v_2)(gv_2 - v_2).
\]
Thus \( a_g(v_3, v_2) = 0 \).

Hence, for all \( v_2 \in V \), \( a_g(v_3, v_2) = 0 \) and so \( V^g \subseteq \ker a_g \).

(d) By (c), \( \text{codim}(V^g) \geq \text{codim}(\ker a_g) \). Since \( a_g \neq 0 \), there exist \( v, w \in V \) with \( a_g(v, w) \neq 0 \) and so \( \text{codim}(\ker a_g) \geq 2 \). Let \( v_1 - gv_1 \) and \( v_2 - gv_2 \) be linearly independent elements of \((V^g)^\perp \). Then (1.7) implies that any element \( v_3 - gv_3 \in (V^g)^\perp \) is a linear combination of \( v_1 - gv_1 \) and \( v_2 - gv_2 \), and so
\[
2 \geq \dim((V^g)^\perp) = \text{codim}(V^g) \geq \text{codim}(\ker a_g) \geq 2.
\]
Thus \( V^g = \ker a_g \) and \( \text{codim}(V^g) = 2 \).

(e) Write \( h_{b_1} = h_{11}b_1 + h_{21}b_2 + (hb_1)^g \) and \( h_{b_2} = h_{12}b_1 + h_{22}b_2 + (hb_2)^g \) with \( h_{ij} \in \mathbb{C} \) and \((hb_i)^g \in V^g \). Then
\[
a_{h^{-1}gb_1}(b_1, b_2) = a_g(h_{b_1}, h_{b_2}) = a_g(h_{11}b_1 + h_{21}b_2 + (hb_1)^g, (h_{12}b_1 + h_{22}b_2 + (hb_2)^g)
\]
\[
= (h_{11}h_{22} - h_{21}h_{12})a_g(b_1, b_2) = \det(h^\perp) a_g(b_1, b_2)
\]
since \( a_g \) is skew symmetric and \( V^g \subseteq \ker a_g \).

The following theorem is a slightly strengthened version of statements (given without proof) in [Dr].
Theorem 1.9. Let $G$ be a finite subgroup of $GL(V)$ and let $Z_G(g) = \{ h \in G \mid hg = gh \}$ denote the centralizer of an element $g$ in $G$.

(a) If $A$ is a graded Hecke algebra for $G$, then the values of $a_{h^{-1}gh}$ are determined by the values of $a_g$ via the equation

$$a_{h^{-1}gh}(v_1, v_2) = a_g(hv_1, hv_2), \quad \text{for all } g, h \in G, v_1, v_2 \in V.$$

(b) For $g \neq 1$, there is a graded Hecke algebra $A$ with $a_g \neq 0$ if and only if

\[
\ker a_g = V^g, \quad \text{codim}(V^g) = 2, \quad \text{and} \quad \det(h^\perp) = 1, \quad \text{for all } h \in Z_G(g),
\]

where $h^\perp$ is $h$ restricted to the space $(V^g)\perp$. In this case, $a_g$ is determined by its value $a_g(b_1, b_2)$ on a basis $\{b_1, b_2\}$ of $(V^g)\perp$.

(c) Let $d$ be the number of conjugacy classes of $g \in G$ such that $\text{codim}(V^g) = 2$ and $\det(h^\perp) = 1$ for all $h \in Z_G(g)$, where $h^\perp$ is $h$ restricted to the space $(V^g)\perp$. The sets $\{a_g\}_{g \in G}$ corresponding to graded Hecke algebras $A$ form a vector space of dimension $d + \dim((\Lambda^2 V)^G)$.

Proof. (a) is simply a restatement of (1.6).

(b) $\Rightarrow$: If $A$ is a graded Hecke algebra and $a_g \neq 0$ then by Lemma 1.8d, $\text{codim}(V^g) = 2$ and $\ker a_g = V^g$. So $a_g$ is determined by its value $a_g(b_1, b_2)$ on a basis $b_1, b_2$ of $(V^g)\perp$. Suppose $h \in Z_G(g)$. Then, by Lemma 1.8e,

$$a_g(b_1, b_2) = a_{hg^{-1}}(hb_1, hb_2) = a_g(hb_1, hb_2) = \det(h^\perp) a_g(b_1, b_2),$$

and so $\det(h^\perp) = 1$. Note that $h(V^g) = V^g$ and $h(V^g)\perp = (V^g)^\perp$ since, for each $v \in V^g$, $h(v) = hg(v) = gh(v)$. Thus $h^\perp$ is, in fact, simply $h$ restricted to $(V^g)^\perp$.

$\Leftarrow$: If $\text{codim}(V^g) = 2$ then, up to constant multiples, there is a unique skew symmetric form on $V$ which is nondegenerate on $(V^g)^\perp$ and which has $\ker a_g = V^g$. Fix such a form and then define forms $a_h, h \in G$, by

$$a_h(v_1, v_2) = \begin{cases} a_g(kv_1, kv_2) & \text{if } h = k^{-1}gk, \\ 0 & \text{otherwise,} \end{cases}$$

(1.10)

for $v_1, v_2 \in V$. Let $a_1$ be any $G$-invariant skew symmetric form on $V$. Then this collection $\{a_g\}_{g \in G}$ of skew symmetric bilinear forms satisfies (1.6) by definition and (1.7) by Lemma 1.8b. Thus (by Lemma 1.5), it determines a graded Hecke algebra $A$ via (1.1).

(c) From (a) and the only if part of (b), it follows that the sets $\{a_g\}_{g \in G}$, running over all graded Hecke algebras $A$ for $G$, form a vector space. Since each of the collections $\{a_g\}_{g \neq 1}$ constructed by (1.10) has its support on a single conjugacy class, these collections form a basis of the vector space of sets $\{a_g\}_{g \neq 1}$. The only condition on the form $a_1$ is that it satisfies (1.6), which means that it is a $G$-invariant element of $(\Lambda^2 V)^*$. $lacksquare$

The following consequence of Theorem 1.9 will be useful for completing the classification of graded Hecke algebras for complex reflection groups.

Corollary 1.11. Assume that $G$ contains $h = \xi \cdot 1$ for some $\xi \neq \pm 1$. If $A$ is a graded Hecke algebra for $G$, then $a_g = 0$ for all $g \neq 1$.

Proof. If $h = \xi \cdot 1 \in G$, then $h \in Z_G(g)$ for every $g \in G$ and $\det(h^\perp) = \xi^2$ if $\text{codim}(V^g) = 2$. The statement then follows from Theorem 1.9b. $lacksquare$
2. The classification for reflection groups

A reflection is an element of $GL(V)$ that has exactly one eigenvalue not equal to 1. The reflecting hyperplane of a reflection is the one-dimensional eigenspace corresponding to its distinguished eigenvalue. A complex reflection group $G$ is a finite subgroup of $GL(V)$ generated by reflections. The group $G$ is irreducible if $V$ cannot be written in the form $V = V_1 \oplus V_2$ where $V_1$ and $V_2$ are $G$-invariant subspaces. The group $G$ is a real reflection group if $V = \mathbb{C} \otimes_{\mathbb{R}} V_{\mathbb{R}}$ for a real vector space $V_{\mathbb{R}}$ and $G \subseteq GL(V_{\mathbb{R}})$.

The following facts about reflection groups are well known.

Lemma 2.1. Let $G$ be an irreducible reflection group.

(a) [ST, Theorem 5.3] The number of elements $g \in G$ such that $\text{codim}(V^g) = 2$ is $\sum_{i<j} m_i m_j$ where $m_1, \ldots, m_n$ are the exponents of $G$.

(b) [Ca, Lemma 2] If $G$ is a real reflection group and $g \in G$ is such that $\text{codim}(V^g) = 2$, then $g$ is the product of two reflections.

(c) [OT, Theorem 6.27] For any $g \in G$, the space $V^g$ is the intersection of reflecting hyperplanes.

Remark. The statement of Lemma 2.1b does not hold for complex reflection groups. Consider the exceptional complex reflection group $G_4$ of rank 2, in the notation of Shephard and Todd [ST]. All the reflections have order 3 and $-1 \in G_4$. Suppose $-1 = rs$ for two reflections $r$ and $s$. If $s$ has eigenvalues 1 and $\omega$, where $\omega$ is a primitive cube root of unity, then $r^{-1} = -s$ has eigenvalues $-1$ and $-\omega$, a contradiction to the assumption that $r$ is a reflection. Thus $-1 \in G_4$ is not a product of two reflections.

Lemma 2.2. Let $G \subseteq GL(V)$ be a complex reflection group. Let $A$ be a graded Hecke algebra for $G$ and let $g \in G$. Let $V^G = \{v \in V \mid gv = v \text{ for all } g \in G\}$ be the invariants in $V$.

(a) If $g = 1$ and $\text{dim} V^G \leq 1$, then $a_g = 0$.

(b) If the order of $g$ is 2, then $a_g = 0$.

Proof. (a) Let $\langle, \rangle : V \times V \to \mathbb{C}$ be a nondegenerate $G$-invariant Hermitian form on $V$ and write $V = V^G \oplus (V^G)^\perp$ where $(V^G)^\perp = \{v \in V \mid \langle v, w \rangle = 0 \text{ for all } w \in V^G\}$. Since $\text{dim}(V^G) \leq 1$ and $a_1$ is skew symmetric, $a_1$ restricted to $V^G$ is 0. There is a basis $\xi_1, \ldots, \xi_k$ of $(V^G)^\perp$ and constants $\xi_1, \ldots, \xi_k \in \mathbb{C}$, $\xi_i \neq 1$, such that the reflections $s_1, \ldots, s_k$ given by

$$s_i v = v + (\xi_i - 1)\frac{\langle v, \alpha_i \rangle}{\langle \alpha_i, \alpha_i \rangle} \alpha_i,$$

for $v \in V$,

are in $G$. Equation (1.6) implies that, for any $v \in V$,

$$a_1(\alpha_i, v) = a_1(s_i \alpha_i, s_i v) = a_1(\xi_i \alpha_i, v + (\xi_i - 1)\frac{\langle v, \alpha_i \rangle}{\langle \alpha_i, \alpha_i \rangle} \alpha_i) - \xi_i a_1(\alpha_i, v),$$

since $a_1(\alpha_i, \alpha_i) = 0$ (as $a_1$ is skew symmetric). Since $\xi_i \neq 1$, $a_1(\alpha_i, v) = 0$ for $1 \leq i \leq k$. Thus $\text{ker} a_1 = V$.

(b) Since $g^2 = 1$, all eigenvalues of $g$ are $\pm 1$. If $\text{codim}(V^g) \neq 2$, then $a_g = 0$ by Theorem 1.9b. If $\text{codim}(V^g) = 2$, then

$$g = \text{id}_{V^g} \oplus (-\text{id}_{(V^g)^\perp})$$

as a linear transformation on $V$. By [St1, Theorem 1.5], [Bou V, §5 Ex. 8], the stabilizer, $\text{Stab}(V^g)$, of $V^g$ is a reflection subgroup of $G$ and so there is a reflection $s \in \text{Stab}(V^g)$ that is the identity on $V^g$. So $s \in Z_G(g)$ and $\text{det}(s) = \text{det}(s^\perp) \neq 1$, where $s^\perp$ is $s$ restricted to $(V^g)^\perp$. Thus, by Theorem 1.9b, $a_g = 0$. ■
2A. Real reflection groups

If \( G \subseteq GL(V) \) is a real reflection group then \( V = \mathbb{C} \otimes_{\mathbb{R}} V_{\mathbb{R}} \) and \( G \subseteq GL(V_{\mathbb{R}}) \), where \( V_{\mathbb{R}} \) is a real vector space. We shall assume that \( G \) is irreducible.

Let us recall some basic facts about real reflection groups which can be found in [Hu] or [Bou]. The action of \( G \) on \( V_{\mathbb{R}} \) has fundamental chambers \( wC \) indexed by \( w \in G \). The roots for \( G \) are vectors \( \alpha \in V_{\mathbb{R}} \) such that the reflections in \( G \) are the reflections \( s_{\alpha} \) in the hyperplanes

\[
H_{\alpha} = \{ v \in V_{\mathbb{R}} \mid \langle v, \alpha \rangle = 0 \}.
\]

For each fundamental chamber \( C \), the reflections \( s_1, s_2, \ldots, s_n \) in the hyperplanes \( H_{\alpha_1}, H_{\alpha_2}, \ldots, H_{\alpha_n} \) that bound \( C \) form a set of simple reflections for \( G \). The simple reflections obtained from a different choice of fundamental chamber \( wC \) are \( ws_1w^{-1}, \ldots, ws_nw^{-1} \).

**Theorem 2.3.** Let \( G \subseteq GL(V_{\mathbb{R}}) \) be a real reflection group. Let \( s_1, \ldots, s_n \) be a set of simple reflections in \( G \) and let \( m_{ij} \) be the order of \( s_is_j \). Then \( g \in G \) satisfies \( g^2 \neq 1 \), \( \text{codim}(V^g) = 2 \), and \( \det(h^\perp) = 1 \) for all \( h \in Z_G(g) \) (the conditions in Theorem 1.9c) if and only if \( g \) is conjugate to

\[
(s_is_j)^k, \quad \text{with } 0 < k < \frac{m_{ij}}{2},
\]

for some \( 1 \leq i, j \leq n \).

**Proof.** \( \Rightarrow \): Let \( \alpha \) and \( \beta \) be two roots such that \( V^g = H_{\alpha} \cap H_{\beta} \) (see Lemma 2.1c). Then \( H_{\alpha} \cap H_{\beta} \) has nontrivial intersection with some fundamental chamber \( C \) for \( W \), and we may assume that \( H_{\alpha} \) and \( H_{\beta} \) are walls of the chamber \( C \) (since \( C \) is a cone in \( \mathbb{R}^n \)). Since choosing simple reflections with respect to a different chamber \( wC \) corresponds to conjugation by \( w \), we may assume that the reflections in the hyperplanes \( H_{\alpha} \) and \( H_{\beta} \) are simple reflections and \( \alpha = \alpha_1 \) and \( \beta = \alpha_2 \).

The element \( g \) is an element of the stabilizer \( \text{Stab}(V^g) \), which is a reflection group by [St1, Theorem 1.5]. Since \( \text{codim}(V^g) = 2 \), \( \text{Stab}(V^g) \) is a rank two real reflection group, and therefore a dihedral group. This dihedral group is generated by the two simple reflections \( s_1 \) and \( s_2 \) in the hyperplanes \( H_{\alpha_1} \) and \( H_{\alpha_2} \) (restricted to \( (V^g)^\perp \)) and all reflections have determinant \(-1\). Let \( g^\perp \) be the element \( g \) restricted to \( (V^g)^\perp \). Since \( g \in Z_G(g) \), \( \det(g^\perp) = 1 \), and so \( g \) must be a product of an even number of reflections. Thus \( g = (s_1s_2)^k \) or \( g = (s_2s_1)^k \), for some \( 0 < k \leq m/2 \), where \( m \) is the order of \( s_is_j \). Since \( g^2 \neq 1 \), \( k \neq m/2 \), and so \( g \) is conjugate to \((s_is_j)^k\) for some \( 0 < k < m/2 \).

\( \Leftarrow: \) Assume that \( g = (s_is_j)^k \) for some \( 0 < k < m_{ij}/2 \). Then \( V^g = H_{\alpha_1} \cap H_{\alpha_2} \) and so \( \text{codim}(V^g) = 2 \). Since \( g \) is a product of an even number of reflections, \( \det(g^\perp) = 1 \). The only elements of \( O(V_{\mathbb{R}}) \cong O_2(\mathbb{R}) \) that are diagonalizable in \( GL(V_{\mathbb{R}}) \cong GL_2(\mathbb{R}) \) are \( \pm I \) and elements with determinant \(-1\). Thus, the eigenvectors of the element \( g^\perp \) (which has distinct eigenvalues since it is not \( \pm I \)) do not lie in \( V_{\mathbb{R}} \), only in \( V = \mathbb{C} \otimes_{\mathbb{R}} \mathbb{R} \). Let \( h \in Z_G(g) \) and let \( h^\perp \in O(V_{\mathbb{R}}) \cong O_2(\mathbb{R}) \) denote \( h \) restricted to \( (V^g)^\perp \). Since \( h^\perp \) commutes with \( g^\perp \) and \( g^\perp \) has distinct eigenvalues, \( g^\perp \) and \( h^\perp \) have the same eigenvectors. Hence, \( \det h^\perp = 1 \).

Using Theorem 2.3 and Theorem 1.9b, we can read off the graded Hecke algebras for the irreducible real reflection groups from the Dynkin diagrams. For each irreducible real reflection group labeled \( G \), we compute the rank \( m \) using the Dynkin diagrams below. If nodes \( i \) and \( j \) and nodes \( j \) and \( k \) are connected by single edges, then \( s_is_j \) is conjugate to \( s_js_k \).
Theorem 2.3, $a_g \neq 0$ for some graded Hecke algebra $A$ only if $g$ is conjugate to the three cycle (1, 2, 3) = $s_1s_2$. (this example is analyzed in Section 3).

Table 1. Graded Hecke algebras for real reflection groups.

Figure 1. Coxeter-Dynkin diagrams for real reflection groups.
2B. Complex reflection groups

The irreducible complex reflection groups were classified by Shephard and Todd [ST]. There is one infinite family denoted $G(r, p, n)$ and a list of exceptional complex reflection groups denoted $G_4, \ldots, G_{35}$. In this subsection, we classify the graded Hecke algebras for the groups $G(r, p, n)$.

Let $r$, $p$, and $n$ be positive integers with $p$ dividing $r$ and let $\xi = e^{2\pi i/r}$. Let $S_n$ be the symmetric group of $n \times n$ matrices and let

$$\xi_j = \text{diag}(1, 1, \ldots, 1, \xi, 1, \ldots, 1),$$

where $\xi$ appears in the $j$th entry. Then

$$G(r, p, n) = \{\xi_1^{\lambda_1} \cdots \xi_n^{\lambda_n} w \mid w \in S_n, 0 < \lambda_i < r - 1, \lambda_1 + \cdots + \lambda_n = 0 \mod p\}.$$

For $\lambda = (\lambda_1, \ldots, \lambda_n) \in (\mathbb{Z}/r\mathbb{Z})^n$, let $\xi^\lambda = \xi_1^{\lambda_1} \cdots \xi_n^{\lambda_n}$. Then the multiplication in $G(r, p, n)$ is described by the relations

$$\xi^\lambda \xi^\mu = \xi^{\lambda + \mu} \quad \text{and} \quad \omega \xi^\lambda = \xi^{\omega \lambda} w, \quad \text{for } \lambda, \mu \in (\mathbb{Z}/r\mathbb{Z})^n, w \in S_n,$$

where $S_n$ acts on $(\mathbb{Z}/r\mathbb{Z})^n$ by permuting the factors. Let $v_i$ be the column vector with 1 in the $i^{th}$ entry and all other entries 0. The group $G(r, p, n)$ acts on $V := \mathbb{C}^n$ with orthonormal basis $\{v_1, \ldots, v_n\}$ as a complex reflection group.

Every real reflection group is a complex reflection group and several of these are special cases of the groups $G(r, p, n)$. In particular,

(a) $G(1, 1, n)$ is the symmetric group $S_n$,

(b) $G(2, 1, n)$ is the Weyl group $WB_n$ of type $B_n$,

(c) $G(2, 2, n)$ is the Weyl group $WD_n$ of type $D_n$, and

(d) $G(r, r, 2)$ is the dihedral group $I_2(r)$ of order $2r$.

The reflections in $G(r, p, n)$ are

$$\xi_i^{kq}, \quad \frac{1}{r} \leq q \leq \frac{r}{p} - 1,$$

$$\xi_i^{kq} \xi_j^{-k}(i, j), \quad 1 \leq i < j \leq n, \quad 0 \leq k \leq r - 1,$$

where $(i, j)$ is the transposition in $S_n$ that switches $i$ and $j$.

Conjugacy in $G(r, p, n)$. Each element of $G(r, p, n)$ is conjugate by elements of $S_n$ to a disjoint product of cycles of the form

$$\xi_i^{\lambda_1} \cdots \xi_k^{\lambda_k}(i, i+1, \ldots, k).$$

By conjugating this cycle by $\xi_i^{-c} \xi_i^{\lambda_1} \xi_{i+1}^{\lambda_{i+1}} \cdots \xi_k^{\lambda_k} \in G(r, r, n)$, we have

$$\xi_i^{-c} \xi_i^{\lambda_1 + \cdots + \lambda_k}(i, \ldots, k), \quad \text{where } c = (k - i)\lambda_i + (k - i - 1)\lambda_{i+1} + \cdots + \lambda_{k-1}.$$

If $i_1, i_2, \ldots, i_\ell$ denote the minimal indices of the cycles and $c_1, \ldots, c_\ell$ are the numbers $c$ for the various cycles, then after conjugating by $\xi_i^{c_1} \cdots \xi_i^{c_\ell} \xi_i^{-c_1 - \cdots - c_\ell - 1} \in G(r, r, n)$, each cycle becomes

$$\xi_i^{\lambda_i + \cdots + \lambda_k}(i, \ldots, k) \quad \text{except the last, which is} \quad \xi_i^{-a} \xi_n^{b}(i_\ell, \ldots, n),$$

where $a = c_1 + \cdots + c_\ell$ and $b = a + \lambda_{i_1} + \cdots + \lambda_n$. If $k = n - i_\ell + 1$ is the length of the last cycle, then conjugating the last cycle by $\xi_i^{k-1} \xi_i^{k-1} \cdots \xi_n^{k-1} \in G(r, r, n)$ gives

$$\xi_i^{-a + k} \xi_n^{b - k}(i_\ell, \ldots, n).$$
If we conjugate the last cycle by \( \xi^p_{i+k} \in G(r,p,n) \), we have

\[
\xi_{i+k}^{-a+p} \xi_n^{-p} (i, i+1, \ldots, n).
\]

In summary, any element \( g \) of \( G(r,p,n) \) is conjugate to a product of disjoint cycles where each cycle is of the form

\[
\xi^a_k (i, i+1, \ldots, k), \quad 0 \leq a \leq r - 1,
\]  
(2.4a)

except possibly the last cycle, which is of the form

\[
\xi^a_k \xi_n (i, i+1, \ldots, n), \quad \text{with } 0 \leq a \leq \gcd(p, k) - 1,
\]  
(2.4b)

where \( k = n - i_k + 1 \) is the length of the last cycle.

**Centralizers in** \( G(r,p,n) \). Let \( Z_{G(r,p,n)} = \{ h \in G(r,p,n) \mid hg = gh \} \) denote the centralizer of \( g \in G(r,p,n) \). Since \( G(r,p,n) \) is a subgroup of \( G(r,1,n) \),

\[
Z_{G(r,p,n)}(g) = Z_{G(r,1,n)}(g) \cap G(r,p,n),
\]

for any element \( g \in G(r,p,n) \). Suppose that \( g \) is an element of \( G(r,1,n) \) which is a product of disjoint cycles of the form \( \xi^a_k (i, \ldots, k) \) and that \( h \in G(r,1,n) \) commutes with \( g \). Conjugating \( g \) by \( h \) effects some combination of the following operations on the cycles of \( g \):

(a) permuting cycles of the same type, \( \xi^a_k (i, \ldots, k) \) and \( \xi^b_m (j, \ldots, m) \) with \( b = a \) and \( k-i = m-j \);

(b) conjugating a single cycle \( \xi^a_k (i, \ldots, k) \) by powers of itself, and

(c) conjugating a single cycle \( \xi^a_k (i, \ldots, k) \) by \( \xi^b_i \cdots \xi^b_k \), for any \( 0 \leq b \leq r - 1 \).

Furthermore, the elements of \( G(r,1,n) \) which commute with \( g \) are determined by how they "rearrange" the cycles of \( g \) and a count (see [Mac, p. 170]) of the number of such operations shows that if \( g \in G(r,1,n) \) and \( m_{a,k} \) is the number of cycles of type \( \xi^a_k (i, i+1, \ldots, i+k) \) for \( g \), then

\[
\text{Card}(Z_{G(r,1,n)}(g)) = \prod_{a,k} (m_{a,k}! \cdot k^{m_{a,k}} \cdot r).
\]  
(2.5)

**Determining the graded Hecke algebras for** \( G(r,p,n) \). It follows from Lemma 1.8a that if \( g = \xi^{a+b}_k \xi^{-a}_k (i, \ldots, k) \), then \( (V^g)^\perp \) has basis

\[
\{v_k - v_{k-1} - v_{k-2} - \cdots - v_{i+1} - v_i \} \quad \text{if } b = 0, \quad \text{and} \quad \{v_i, \ldots, v_k\} \quad \text{if } b \neq 0.
\]

Thus, if \( g \in G(r, p, n) \) and \( \text{codim}(V^g) = 2 \), then \( g \) is conjugate to one of the following elements:

\[
\begin{align*}
b &= \xi_1 \xi_3^{-a}(1, 2, 3), \quad 0 \leq a \leq \gcd(p, 3) - 1, \\
c &= \xi_1^{a+\ell} \xi_2^{-a}(1, 2), \quad \ell \neq 0 \text{ (so } r \neq 1), \\
d &= \xi_1^{\ell_1} \xi_2^{\ell_2}, \quad \ell_1 \neq 0, \ell_2 \neq 0 \text{ (so } r \neq 1), \\
e &= (1, 2) \xi_3^a, \quad \ell \neq 0, \\
f &= (1, 2) \xi_3^a \xi_4^{-a}(3, 4).
\end{align*}
\]

It is interesting to note that these elements are also representatives of the conjugacy classes of elements in \( G(r, p, n) \) which can be written as a product of two reflections.
We determine conditions on the above elements and on \( r, p, \) and \( n \) to give nontrivial graded Hecke algebras:

(z) The center of \( G(r, p, n) \) is

\[ Z(G(r, p, n)) = \{ \xi_1^k \cdots \xi_n^k \mid nk = 0 \mod p \}. \]

Since \( \xi_1^p \cdots \xi_n^p \in Z(G(r, p, n)) \), it follows that \( p = r \) or \( p = r/2 \) whenever \( Z(G(r, p, n)) \subseteq \{ \pm 1 \} = \{ \xi_1^0 \cdots \xi_n^0, \xi_1^{r/2} \cdots \xi_n^{r/2} \} \).

(b1) If \( n \geq 4 \), the element \( \xi_1 \xi_2 \xi_3 \xi_4^{-3} \in Z_G(b) \) and has determinant \( \xi^2 \) on \( (V^b)^\perp = \text{span}\{v_3 - v_2, v_2 - \xi^2v_1\} \).

(b2) If \( n = 3 \) and \( p = 0 \mod 3 \), the element \( \xi_1^{p/3} \xi_2^{p/3} \xi_3^{p/3} \in Z_G(b) \) and has determinant \( \xi^{2p/3} \) on \( (V^b)^\perp \).

(c1) If \( n \geq 3 \), the element \( \xi_1 \xi_2 \xi_3^{-2} \in Z_G(c) \) and has determinant \( \xi^2 \) on \( (V^c)^\perp = \text{span}\{v_1, v_2\} \).

(c2) If \( n = 2 \), \( p = r/2 \) and \( p \) is odd, the element \( \xi_1^{p/4} \xi_2^{p/4} \in Z_G(c) \) and has determinant \( \xi^{r/2} \) on \( (V^c)^\perp \).

(d1) If \( n \geq 3 \), the element \( \xi_1 \xi_3^{-1} \in Z_G(d) \) and has determinant \( \xi \) on \( (V^d)^\perp = \text{span}\{v_1, v_2\} \).

(d2) If \( p = r/2 \), the element \( \xi_1^{r/2} \in Z_G(d) \) and has determinant \( \xi^{r/2} \) on \( (V^d)^\perp \).

Thus, it follows from Corollary 1.11, Theorem 1.9b, and Lemma 2.2b that if \( A \) is a graded Hecke algebra for \( G(r, p, n) \), then

\[ a_b = 0 \quad \text{unless} \quad \begin{align*}
(i) & \ r = 1, \text{ or} \\
(ii) & \ r = 2, \text{ or} \\
(iii) & \ n = 3 \text{ and } p \neq 0 \mod 3,
\end{align*} \]

\[ a_c = 0 \quad \text{unless} \quad \begin{align*}
(i) & \ r = 2 \text{ and } p = 1, \text{ or} \\
(ii) & \ n = 2 \text{ and } p = r/2,
\end{align*} \]

\[ a_d = 0 \quad \text{unless} \quad p = r, n = 2 \text{ and } p \neq 0 \mod 2, \]

\[ a_e = 0 \quad \text{always}, \] and

\[ a_f = 0 \quad \text{always}. \]

In the remaining cases, one uses the description of \( Z_G(g) \) given just before (2.5) to check that all elements of \( Z_G(g) \) have determinant 1 on \( (V^g)^\perp \). Note that \( n = 3 \) and \( p \neq 0 \mod 3 \) imply that \( a_b = 0 \) for the elements \( b = \xi_1 \xi_3^{-a}(1, 2, 3) \).

We arrive at the following enumeration of the nontrivial graded Hecke algebras for complex reflection groups. (The tensor product algebra \( S(V) \otimes CG \) always exists and corresponds to the case when all of the skew symmetric forms \( a_a \) are zero). The table below gives representatives of the conjugacy classes of \( g \in G \) that may have \( a_g \neq 0 \) for some graded Hecke algebra \( A \).
2C. Exceptional complex reflection groups

The irreducible exceptional complex reflection groups $G$ are denoted $G_4, \ldots, G_{35}$ in the classification of Shephard and Todd. From Table VII in [ST], one sees that the center of $G$ is ±1 only in the cases $G_4$, $G_{12}$, $G_{24}$ and $G_{33}$. By Schur's lemma, the center of an irreducible complex reflection group consists of multiples of the identity. Thus, by Corollary 1.11, the only exceptional complex reflection groups that could have a nontrivial graded Hecke algebra (i.e., one for which there are $a_g \neq 0$) are $G_4$, $G_{12}$, $G_{24}$ and $G_{33}$ (we exclude the real groups). We determine the graded Hecke algebras for these groups using Theorem 1.9b and Lemma 2.2.

The rank 2 group $G_4$ has order 24 and seven conjugacy classes. The following data concerning these conjugacy classes is obtained from the computer software GAP [S+] using the package CHEVIE [G+]. In the following table, $\omega$ is a primitive cube root of unity and $C(g)$ denotes the conjugacy class of $g$.

| Conjugacy class representatives for $G_4$ |
|-------------------------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
| Order($g$) | 1 | 4 | 3 | 6 | 6 | 3 | 2 |
| det($g$) | 1 | 1 | $\omega$ | $\omega$ | $\omega^{-1}$ | $\omega^{-1}$ | 1 |
| $|C(g)|$ | 1 | 6 | 4 | 4 | 4 | 4 | 1 |
| $|Z_G(g)|$ | 24 | 4 | 6 | 6 | 6 | 6 | 24 |

The elements with determinant 1 and order more than 2 in $G_4$ all have order 4. If $g$ is an element of order 4, then $|Z_G(g)| = 4$ and every element of $Z_G(g)$ has determinant 1 since $Z_G(g)$ is generated by $g$. Hence, by Theorem 1.9b and Lemma 2.2, $a_g$ can be nonzero for a graded Hecke algebra for $G_4$ exactly when $g$ has order 4. Thus, the dimension of the space of parameters for graded Hecke algebras of $G_{24}$ is 1.

The rank 2 group $G_{12}$ has order 48. The computer software GAP provides the following
information about the conjugacy classes of $G_{12}$.

| Conjugacy class representatives for $G_{12}$ |
|----------|--------|--------|--------|--------|--------|--------|--------|
| Order($g$) | 1     | 2     | 8     | 6     | 8     | 2     | 3     | 4     |
| det($g$)   | 1     | -1    | -1    | 1     | -1    | 1     | 1     | 1     |
| |C($g$)| 1   | 12   | 6     | 8     | 6     | 1     | 8     | 6     |
| |Z$_G$($g$)| 48   | 4     | 8     | 6     | 8     | 48    | 6     | 8     |

If $g$ is an element in $G_{12}$ with order more than 2 and determinant 1, then $g$ has order 3, 4, or 6. Let $h$ be any element of order 8. Then $h$ has determinant $-1$ and commutes with $h^2$ of order 4. Hence, by Theorem 1.9b, if $g$ has order 4, then $a_g = 0$. Let $g_6$ be a representative from the class of elements of order 6. Since $|Z$_G$(g_6)| = 6$, $Z$_G$(g_6)$ is generated by $g_6$ and hence every element of $Z$_G$(g_6)$ has determinant 1. We can choose $g_6^2$ as a representative for the conjugacy class of elements of order 3. As $g_6$ and $g_6^2$ commute, $(g_6) \subset Z$_G$(g_6^2)$. But $|(g_6)| = 6 = |Z$_G$(g_3)|$, so $Z$_G$(g_6^2)$ is generated by $g_6$ and every element of $Z$_G$(g_3)$ has determinant 1. Thus, $a_g$ can be nonzero for a graded Hecke algebra $A$ for $G_{12}$ exactly when $g$ has order 3 or 6. Thus, the dimension of the space of parameters of graded Hecke algebras for $G_{12}$ is 2.

The rank 3 group $G_{24}$ has order 336. Note that $-1 \in G_{24}$ since $Z(G) = \{\pm 1\}$. Up to $G$-orbits, there are two codimension 2 subspaces, $L$ and $M$, that are equal to $V^g$ for some $g \in G_{24}$ (see [OT, App. C, Table C.5]). Furthermore, $\text{Stab}(L) \cong A_2$ and $\text{Stab}(M) \cong B_2$. We need only consider elements of order 3 in $\text{Stab}(L) \cong A_2$ and of order 4 in $\text{Stab}(M) \cong B_2$ (as the rest have order 2). In $G_{24}$, there is only one conjugacy class of elements of order 3 and only one conjugacy class of elements of order 4 and determinant 1. The table below (obtained using GAP) records information about these classes.

| Certain classes of $G_{24}$ |
|-----------------------------|---|---|
| Order($g$)                  | 3 | 4 |
| det($g$)                    | 1 | 1 |
| |C($g$)| 56 | 42 |
| |Z$_G$($g$)| 6 | 8 |

For $g$ of order 3, $Z$_G$(g)$ must contain $1, g, g^2$ and $-1$, and hence $Z$_G$(g)$ is generated by these elements since $|Z$_G$(g)| = 6$. Thus all elements of $Z$_G$(g)$ have determinant 1 on $(V^g)^\perp$. If $g$ has order 4 and determinant 1, then $Z$_G$(g)$ must contain $1, g, g^2, g^3$ and $-1$, elements which all have determinant 1 on $(V^g)^\perp$. Since $|Z$_G$(g)| = 8$, these elements generate $Z$_G$(g)$ and so every element of $Z$_G$(g)$ has determinant 1 on $(V^g)^\perp$. Hence, $a_g$ can be nonzero for a graded Hecke algebra of $G_{24}$ exactly when $g$ has order 3 or $g$ has order 4 and determinant 1. Thus, the dimension of the space of parameters for graded Hecke algebras for $G_{24}$ is 2.

The group $G_{33}$ is the only exceptional complex reflection group of rank 5. It has order $72 \cdot 6!$ and degrees $4, 6, 10, 12, 18$. There are 45 reflecting hyperplanes and the corresponding reflections all have order 2. Up to $G$-orbits, there are two codimension 2 subspaces, $L$ and $M$, that are equal
to $V^g$ for some $g \in G_{33}$ (see [OT, App. C, Table C.14]). Furthermore, $\text{Stab}(L) \cong A_1 \times A_1$ and $\text{Stab}(M) \cong A_2$. We need not consider the case where $V^g = L$ since then $g$ has order 2 and hence $a_g = 0$ for any graded Hecke algebra by Proposition 2.1b.

Use the presentation for $G_{33}$ in six coordinates from [ST]: $V = \{(x_1, x_2, x_3, x_4, x_5, x_6) \mid x_i \in \mathbb{C}\}$ and the group is generated by order 2 reflections about the hyperplanes $H_1 = \{x_2 - x_3 = 0\}$, $H_2 = \{x_3 - x_4 = 0\}$, $H_3 = \{x_1 - x_2 = 0\}$, $H_4 = \{x_1 - \omega x_2 = 0\}$, $H_5 = \{x_1 + x_2 + x_3 + x_4 + x_5 + x_6 = 0\}$, where $\omega$ is a primitive cube root of unity. In this realization, $V^G = H_1 \cap \cdots \cap H_5 = \{(0, 0, 0, 0, x, -x) \mid x \in \mathbb{C}\}$ has dimension 1. Let $s_i$ be the order 2 reflection about $H_i$. Let $g = s_1 s_3$. Then $V^g = H_1 \cap H_3$ and we can assume that $V^g = M$ (as the order of $g$ is not 2). Let $h = (s_1 s_3 s_4)^2$, the diagonal matrix with diagonal $\{\omega, \omega, \omega, 1, 1, 1\}$. Then $h$ acts as $\omega$ times the identity on $(V^g)^{\perp}$ as $(V^g)^{\perp} \subseteq \text{C-span}\{x_1, x_2, x_3\}$. Hence, $h$ commutes with $g$. But $(V^g)^{\perp}$ has dimension 2 and $h$ has determinant $\omega^2 \neq 1$ on $(V^g)^{\perp}$. Thus, by Theorem 1.9b, $a_g = 0$ for any graded Hecke algebra. In summary, the dimension of the space of parameters for graded Hecke algebras for $G_{33}$ is zero.

Table 3. Graded Hecke algebras for exceptional complex reflection groups.

3. The graded Hecke algebras $H_{gr}$

In [Lu], Lusztig gives a definition of graded Hecke algebras for real reflection groups which is different from the definition in Section 1, which applies to more general groups. It is not obvious that Lusztig's algebras are examples of the graded Hecke algebras defined in Section 1. In this section, we show explicitly how the definition of Section 1 includes Lusztig's algebras.

Let $W$ be a finite real reflection group and let $R$ be the root system of $W$. Let $\alpha_1, \ldots, \alpha_n$ be a choice of simple roots in $R$ and let $s_1, \ldots, s_n$ be the corresponding simple reflections in $W$. Let $s_\alpha$ be the reflection in the root $\alpha$ so that, for $v \in V$,

$$
    s_\alpha v = v - \langle v, \alpha^\vee \rangle \alpha,
$$

where $\alpha^\vee = 2\alpha / \langle \alpha, \alpha \rangle$.

Let $R^+ = \{\alpha > 0\}$ denote the set of positive roots in $R$.

Let $k_\alpha$ be fixed complex numbers indexed by the roots $\alpha \in R$ satisfying

$$
    k_{w \alpha} = k_\alpha, \quad \text{for all } w \in W, \alpha \in R.
$$

(3.1)

This amounts to a choice of either one or two "parameters", depending on whether all roots in $R$ are the same length or not. As in Section 1, let $C = \text{C-span}\{t_g \mid g \in W\}$, with $t_g t_h = t_{gh}$, and let $S(V)$ be the symmetric algebra of the reflection representation $V$ of $W$. Lusztig [Lu] defines the "graded Hecke algebra" with parameters $\{k_\alpha\}$ to be the unique algebra structure $H_{gr}$ on the vector space $S(V) \otimes C$ such that

(3.2 a) $S(V) = S(V) \otimes 1$ is a subalgebra of $H_{gr}$,

(3.2 b) $C W = 1 \otimes C W$ is a subalgebra of $H_{gr}$, and

(3.2 c) $t_{s_i} v = (s_i v) t_{s_i} - k_{\alpha_i} \langle v, \alpha_i^\vee \rangle$, for all $v \in V$ and simple reflections $s_i$ in the simple roots $\alpha_i$.

We shall show that every algebra $H_{gr}$ as defined by (3.2 a-c) is a graded Hecke algebra $A$ for a specific set of skew symmetric bilinear forms $a_g$. 
Let $k_\alpha \in \mathbb{C}$ as in (3.1). Use the notation
\[
h = \frac{1}{2} \sum_{\alpha > 0} k_\alpha \alpha^\vee t_{s_\alpha}, \quad \text{so that} \quad \langle v, h \rangle = \frac{1}{2} \sum_{\alpha > 0} k_\alpha \langle v, \alpha^\vee \rangle t_{s_\alpha}
\] (3.3)
for $v \in V$. The element $h$ should be viewed as an element of $V \otimes \mathbb{C}W$, and $\langle v, h \rangle \in \mathbb{C}W$. With this notation, let $A$ be the algebra (as in Section 1) generated by $V$ and $\mathbb{C}W$ with relations
\[
t_g v = (gv)t_g \quad \text{and} \quad [v, w] = -\langle \langle v, h \rangle, \langle w, h \rangle \rangle, \quad \text{for } v, w \in V, \ g \in W.
\] (3.4)
Note that $A$ is defined by the bilinear forms
\[
a_g (v, w) = \frac{1}{2} \sum_{\alpha, \beta > 0, g = s_\alpha s_\beta} k_\alpha k_\beta \langle \langle v, \beta^\vee \rangle \langle w, \alpha^\vee \rangle - \langle v, \alpha^\vee \rangle \langle w, \beta^\vee \rangle \rangle.
\]

The following theorem shows that the algebra $A$ satisfies the defining conditions (3.2 a-c) of the algebra $H_{gr}$.

**Theorem 3.5.** Let $W$ be a finite real reflection group and let $A$ be the algebra defined by (3.4).

(a) As vector spaces, $A \cong S(V) \otimes \mathbb{C}W$ (and hence, $A$ is a graded Hecke algebra).

(b) If $\tilde{v} = v - \langle v, h \rangle$ for $v \in V$, then
\[
[\tilde{v}, \tilde{w}] = 0 \quad \text{and} \quad t_{s_i} \tilde{v} = (s_i \tilde{v})t_{s_i} - k_{\alpha_i} \langle v, \alpha_i^\vee \rangle,
\]
for all $v, w \in V$ and simple reflections $s_i$ in $W$.

**Proof.** First note that if $u, v \in V$ then
\[
[u, \langle v, h \rangle] = \frac{1}{2} \sum_{\alpha > 0} k_\alpha \langle v, \alpha^\vee \rangle \langle u, \alpha^\vee \rangle t_{s_\alpha} = [v, \langle u, h \rangle].
\]
Thus, for $u, v, w \in V$,
\[
[u, [v, w]] + [w, [u, v]] + [v, [w, u]]
\]
\[
= [u, \langle \langle u, h \rangle, \langle v, h \rangle \rangle] + [w, \langle \langle u, h \rangle, \langle v, h \rangle \rangle] + [v, \langle \langle u, h \rangle, \langle v, h \rangle \rangle]
\]
\[
= [[u, \langle u, h \rangle], \langle v, h \rangle] + [[w, \langle u, h \rangle], \langle v, h \rangle] + [[w, \langle v, h \rangle], \langle u, h \rangle]
\]
\[
+ [[v, \langle u, h \rangle], \langle w, h \rangle] + [[v, \langle u, h \rangle], \langle u, h \rangle] + [[u, \langle u, h \rangle], \langle w, h \rangle] + [[u, \langle v, h \rangle], \langle u, h \rangle]
\]
\[
= [[w, \langle u, h \rangle], \langle v, h \rangle] + [[w, \langle v, h \rangle], \langle u, h \rangle] + [[v, \langle u, h \rangle], \langle w, h \rangle] + [[v, \langle v, h \rangle], \langle u, h \rangle]
\]
\[
+ [[u, \langle u, h \rangle], \langle w, h \rangle] + [[v, \langle u, h \rangle], \langle w, h \rangle] + [[u, \langle v, h \rangle], \langle v, h \rangle]
\]
\[
= 0.
\] (3.6)

For $v \in V$, $h \in W$, and $s_i$ a simple reflection,
\[
t_{s_i} \langle v, h \rangle t_{s_i} = \frac{1}{2} \sum_{\alpha > 0} k_\alpha \langle v, \alpha^\vee \rangle t_{s_i s_\alpha} = \left( \frac{1}{2} \sum_{\alpha > 0} k_\alpha \langle v, s_i \alpha^\vee \rangle t_{s_\alpha} \right) + k_{\alpha_i} \langle v, \alpha_i^\vee \rangle t_{s_i}
\]
\[
= \left( \frac{1}{2} \sum_{\alpha > 0} k_\alpha \langle s_i v, \alpha^\vee \rangle t_{s_\alpha} \right) + k_{\alpha_i} \langle v, \alpha_i^\vee \rangle t_{s_i} = \langle s_i v, h \rangle + k_{\alpha_i} \langle v, \alpha_i^\vee \rangle t_{s_i}.
\] (3.7)
Using this equality, we obtain
\begin{align*}
t_{s_i}[v, w]t_{s_i} &= -t_{s_i}[(v, h), (w, h)]t_{s_i} \\
&= -[(s_i v, h) + k_{s_i}(v, \alpha_i^\vee)t_{s_i}(s_i w, h) + k_{s_i}(w, \alpha_i^\vee)t_{s_i}] \\
&= [s_i v, s_i w] - k_{s_i}(v, \alpha_i^\vee)t_{s_i}(s_i w, h) - k_{s_i}(w, \alpha_i^\vee)(s_i v, h), t_{s_i}] \\
&= [s_i v, s_i w] - k_{s_i}(v, \alpha_i^\vee)(t_{s_i}(s_i w, h)t_{s_i} - (s_i w, h)t_{s_i}) \\
&\quad + k_{s_i}(w, \alpha_i^\vee)(t_{s_i}(s_i v, h)t_{s_i} - (s_i v, h)t_{s_i}) \\
&= [s_i v, s_i w] - k_{s_i}(v, \alpha_i^\vee)((w, h)t_{s_i} + k_{s_i}(s_i w, \alpha_i^\vee) - (s_i w, h)t_{s_i}) \\
&\quad + k_{s_i}(w, \alpha_i^\vee)((v, h)t_{s_i} + k_{s_i}(s_i v, \alpha_i^\vee) - (s_i v, h)t_{s_i}) \\
&= [s_i v, s_i w] - k_{s_i}(v, \alpha_i^\vee)(w, \alpha_i^\vee)(s_i v, \alpha_i^\vee) + k_{s_i}(w, \alpha_i^\vee)(w, \alpha_i^\vee) \\
&\quad + k_{s_i}(w, \alpha_i^\vee)(v, \alpha_i^\vee)(s_i v, \alpha_i^\vee) + k_{s_i}^2(w, \alpha_i^\vee)(v, s_i \alpha_i^\vee) \\
&= [s_i v, s_i w].
\end{align*}

The two identities (3.6) and (3.8), as in (1.3) and (1.4), show that the algebra $A$ is isomorphic to $S(V) \otimes CW$.

(b) This can now be proved by direct computation. If $v, w \in V$ then, since $[v, t_{s\alpha}] = vt_{s\alpha} - t_{s\alpha}v = vt_{s\alpha} - (s\alpha v)t_{s\alpha} = (v, \alpha^\vee)\alpha t_{s\alpha}$,
\begin{align*}
[\bar{v}, \bar{w}] &= [v - (v, h), w - (w, h)] = [v, w] + [(v, h), (w, h)] - [v, (w, h)] + [w, (v, h)] \\
&= [v, w] - [v, w] + \frac{1}{2} \sum_{\alpha > 0} k_{\alpha}(-\langle w, \alpha^\vee \rangle [v, t_{s\alpha}] + \langle v, \alpha^\vee \rangle [w, t_{s\alpha}]) \\
&= \frac{1}{2} \sum_{\alpha > 0} k_{\alpha}(-\langle w, \alpha^\vee \rangle \langle v, \alpha^\vee \rangle \alpha t_{s\alpha} + \langle v, \alpha^\vee \rangle \langle w, \alpha^\vee \rangle \alpha t_{s\alpha}) = 0.
\end{align*}

If $v \in V$ and $s_i$ is a simple reflection then, by (3.7),
\begin{align*}
t_{s_i}t_{s_i} &= t_{s_i}vt_{s_i} - t_{s_i}(v, h)t_{s_i} = s_i v - (s_i v, h) - k_{s_i}(v, \alpha_i^\vee)t_{s_i} = s_i v - k_{s_i}(v, \alpha_i^\vee)t_{s_i}.
\end{align*}

Theorem 3.5b shows that if $A$ is the graded Hecke algebra defined by (3.4), then the elements $\bar{v}, v \in V$, generate a subalgebra of $A$ isomorphic to $S(V)$ and these elements together with the $t_{s_i}$ satisfy the relations of (3.2 c). Since part (a) of Theorem 3.5 shows that $A$ is isomorphic to $S(V) \otimes CW$ as a vector space, it follows that $A$ satisfies the conditions (3.2 a-c), relations which uniquely define the graded Hecke algebra $A$. Thus, Lusztig's algebras are special cases of the graded Hecke algebras defined in Section 1. Furthermore, by comparing the dimensions of the parameter spaces, we see that there are graded Hecke algebras that are not isomorphic to algebras defined by Lusztig for the Coxeter groups $F_4$, $H_3$, $H_4$, and $I_2(m)$.

4. Examples

4A. The symmetric group $G(1, 1, n) = S_n$

Let $V$ be an $n$ dimensional vector space with orthonormal basis $v_1, \ldots, v_n$ and let $S_n$ act on $V$ by permuting the $v_i$. Let $A$ be a graded Hecke algebra for $S_n$. Any element which is a product of two reflections is conjugate to $(1, 2, 3)$ or $(1, 2)(3, 4)$. The element $(1, 2)(3, 4)$ has order 2 and so, in the algebra $A$,
\begin{align*}
[v_i, v_j] &= \sum_{k \neq i, j} (a_{(i, j, k)}(v_i, v_j)t_{(i, j, k)} + a_{(j, i, k)}(v_i, v_j)t_{(j, i, k)}),
\end{align*}
since \( v_i \) or \( v_j \) is in \( V^g = \ker a_g \) for all other three cycles \( g \). Since, by (1.6), \( a_{(i,j,k)}(v_j,v_i) = a_{(i,j,k)}(v_i,v_j) = -a_{(i,j,k)}(v_i,v_j) \), the graded Hecke algebra \( A \) is defined by the relations

\[
[v_i, v_j] = \beta \sum_{k \neq i,j} (t_{(i,j,k)} - t_{(j,i,k)}) \quad \text{and} \quad t_w v_i = v_w(t) t_w,
\]

where \( w \in S_n, 1 \leq i, j \leq n, i \neq j \), and \( \beta = a_{(1,2,3)}(v_1,v_2) \).

Let \( k \in \mathbb{C} \). Then, with \( h \) as in (3.3),

\[
\langle v_i, h \rangle = \frac{1}{2} \sum_{\ell < m} k(v_i, v_{\ell} - v_m) t_{(\ell,m)} = \frac{k}{2} \left( \sum_{i < \ell} t_{(i,\ell)} - \sum_{i > \ell} t_{(\ell,i)} \right) = \frac{k}{2} \sum_{i \neq \ell} \text{sgn}(\ell - i) t_{(i,\ell)}.
\]

If \( f \in CS_n \), let \( f|_{t_g} \) denote the coefficient of \( t_g \) in \( f \). Let \( A \) be the graded Hecke algebra defined by the relations in (4.1) with

\[
\beta = a_{(i,j,\ell)}(v_i, v_j) = \left[ \langle v_i, h \rangle, \langle v_j, h \rangle \right]_{t_{(i,j,\ell)}}
\]

\[
= \left( k^2/4 \right) \left( t_{(i,\ell)} t_{(j,\ell)} + t_{(j,\ell)} t_{(i,\ell)} - t_{(j,\ell)} t_{(i,\ell)} \right)_{t_{(i,j,\ell)}} = k^2/4.
\]

If \( \bar{v}_i = v_i - \langle v_i, h \rangle \) and \( s_i \) is the simple reflection \( (i, i+1) \) then, by Theorem 3.5,

\[
\bar{v}_i \bar{v}_j = \bar{v}_j \bar{v}_i, \quad s_i \bar{v}_i = \bar{v}_{i+1} s_i + k, \quad t_{s_i} \bar{v}_{i+1} = \bar{v}_i t_{s_i} - k, \quad \text{and}
\]

\[
t_{s_i} \bar{v}_i = \bar{v}_i t_{s_i}, \quad \text{for } |i - j| > 1,
\]

and the algebra \( A \) is the graded Hecke algebra \( H_{gr} \) for \( S_n \) which is defined in Section 3. When \( k = 1 \), the map

\[
\begin{array}{ccc}
A & \longrightarrow & CS_n \\
t_w & \longmapsto & t_w \\\n v_i & \longmapsto & \frac{1}{2} \sum_{\ell \neq i} t_{(i,\ell)}
\end{array}
\]

is a surjective algebra homomorphism.

4B. The hyperoctahedral group \( G(2,1,n) = WB_n \)

We use the notation from Section 2B so that the group \( G(2,1,n) \) is acting by orthogonal matrices on the \( n \) dimensional vector space \( V \) with orthonormal basis \( \{v_1, \ldots, v_n\} \). In this case, \( \xi_i \) denotes the diagonal matrix with all ones on the diagonal except for \(-1\) in the \((i,i)\)th entry.

Let \( A \) be a graded Hecke algebra for \( G(2,1,n) \). If \( \beta_1 = a_{(i,j,k)}(v_i, v_j) \) and \( \beta_2 = a_{(1,2)}(v_1,v_2) \), then, in the algebra \( A \),

\[
[v_i, v_j] = \beta_2(t_{\xi_1(1,2)} - t_{\xi_2(1,2)}) + \beta_1 \sum_{\ell \neq i,j} \left( t_{(i,j,\ell)} - t_{\xi_\ell(\xi_1(1,2))} - t_{\xi_\ell(\xi_2(1,2))} + t_{\xi_\ell(\xi_1(1,2))} \right) \]

\[
= \frac{k}{2} \sum_{\ell} \langle v_i, 2v_\ell \rangle t_{\ell} - \frac{k}{2} \sum_{\ell < m} \langle v_i, v_\ell - v_m \rangle t_{(\ell,m)} - \frac{k}{2} \sum_{\ell < m} \langle v_i, v_\ell + v_m \rangle t_{(\ell,m)} \]

\[
= k_s t_{\xi_i} - \frac{k}{2} \left( \sum_{i < \ell} t_{(i,\ell)} + t_{\xi_\ell(\xi_1(1,2))} \right) + \sum_{i > \ell} (-t_{(i,\ell)} + t_{\xi_\ell(\xi_2(1,2))}) \quad (4.6)
\]
If \( f \in \mathcal{C}(2, 1, n) \), let \( f|_{t_g} \) denote the coefficient of \( t_g \) in \( f \). With notation as in (4.6), let \( A \) be the graded Hecke algebra for \( G(2, 1, n) \) with
\[
\beta_1 = a_{(i,j,k)}(v_i, v_j) = [(v_i, h), (v_j, h)]|_{t_{(i,j,k)}} = (k^2/4)(t_{(i,j,k)}t_{(j,i,k)} + t_{(i,j,k)}t_{(j,i,k)})|_{t_{(i,j,k)}} = k^2/4,
\]
and
\[
\beta_2 = [(v_i, h), (v_j, h)]|_{t_{\epsilon(i,j)}} = (1/2)k_\epsilon k_{\epsilon(j,i)}t_{\epsilon(i,j)}|_{t_{\epsilon(i,j)}} = -k_\epsilon k_{\epsilon(j,i)}.
\]
If \( v_i = v_i - \langle v_i, h \rangle \), then, by Theorem 3.5, the \( \tilde{v}_i \) commute and the algebra \( A \) is the algebra \( H_{\text{gr}} \) for \( WB_n \) defined in Section 3.

### 4C. The type \( D_n \) Weyl group \( G(2, 2, n) = WD_n \)

We shall use the notation from Section 2B so that the group \( G(2, 2, n) \) is acting by orthogonal matrices on the \( n \) dimensional vector space \( V \) with orthonormal basis \( \{v_1, \ldots, v_n\} \). This is an index 2 subgroup of \( G(2, 1, n) \), and our notation is the same as used above for \( WB_n \).

Let \( A \) be a graded Hecke algebra for \( G(2, 2, n) \). If \( \beta = a_{(i,j,k)}(v_i, v_j) \) then, in the algebra \( A \),
\[
[v_i, v_j] = \beta \sum_{\ell \neq i,j} \left( t_{(i,j,k)} - t_{\epsilon(i,j,k)}t_{(i,j,k)} + t_{\epsilon(i,j,k)}t_{(i,j,k)} - t_{\epsilon(i,j,k)} t_{(i,j,k)} - t_{\epsilon(i,j,k)} t_{(i,j,k)} \right).
\]
(4.8)

Let \( k \in \mathbb{C} \). Then, with \( h \) as in (3.3),
\[
\langle v_i, h \rangle = \frac{k}{2} \left( \sum_{i \neq \ell} (t_{(i,\ell)} + t_{\epsilon(i,\ell)}t_{(i,\ell)}) + \sum_{i > \ell} (-t_{(i,\ell)} + t_{\epsilon(i,\ell)}t_{(i,\ell)}) \right).
\]
(4.9)

If \( f \in \mathcal{C}(2, 2, n) \), let \( f|_{t_g} \) denote the coefficient of \( t_g \) in \( f \). With notation as in (4.8), let \( A \) be the graded Hecke algebra for \( G(2, 2, n) \) with
\[
\beta = a_{(i,j,k)}(v_i, v_j) = [(v_i, h), (v_j, h)]|_{t_{(i,j,k)}} = (k^2/4)(t_{(i,j,k)}t_{(j,i,k)} + t_{(i,j,k)}t_{(j,i,k)} - t_{(j,i,k)} t_{(j,i,k)} - t_{(j,i,k)} t_{(j,i,k)})|_{t_{(i,j,k)}} = k^2/4.
\]

If \( \tilde{v}_i = v_i - \langle v_i, h \rangle \), then, by Theorem 3.5, the \( \tilde{v}_i \) commute and the algebra \( A \) is the algebra \( H_{\text{gr}} \) for \( WD_n \) defined in Section 3.

### 4D. The dihedral group \( I_2(r) = G(r, r, 2) \) of order \( 2r \)

We shall use the notation for \( G(r, r, 2) \) from Section 2B so that the group \( G(r, r, 2) \) is acting by unitary matrices on the 2 dimensional vector space \( V \) with orthonormal basis \( \{v_1, v_2\} \). The group \( G(r, r, 2) \) is realized as a real reflection group by using the basis
\[
\varepsilon_1 = \frac{1}{\sqrt{2}}(v_1 + v_2), \quad \varepsilon_2 = \frac{-1}{\sqrt{2}}(v_1 - v_2).
\]

This basis is also orthonormal and, with respect to this basis, \( G(r, r, 2) \) acts by the matrices
\[
\begin{pmatrix}
\cos(2\pi m/r) & \pm \sin(2\pi m/r) \\
\sin(2\pi m/r) & \pm \cos(2\pi m/r)
\end{pmatrix}, \quad 0 \leq m \leq r - 1.
\]
Let $A$ be a graded Hecke algebra for $G(r, r, 2)$. The conjugacy classes of elements which are products of two reflections are $\{\xi_1^k \xi_2^{-k}, \xi_1^{-k} \xi_2^k\}$, $0 < k < r/2$. Then, in the algebra $A$,
\[
[\varepsilon_1, \varepsilon_2] = \sum_{0 < k < r/2} \beta_k (t_{\xi_1^k \xi_2^{-k}} - t_{\xi_1^{-k} \xi_2^k}), \quad \text{where} \quad \beta_k = a_{\xi_1^k \xi_2^{-k}}(\varepsilon_1, \varepsilon_2). \quad (4.10)
\]

When $r$ is even, there are two conjugacy classes of reflections
\[
\{\xi_1^{2k} \xi_2^{-2k} (1, 2) \mid 0 \leq k < r/2\} \quad \text{and} \quad \{\xi_1^{2k+1} \xi_2^{-(2k+1)} (1, 2) \mid 0 \leq k < r/2\}.
\]
The reflection $\xi_1^m \xi_2^{-m} (12)$ is the reflection in the line perpendicular to the vector
\[
\alpha_m = \sin(-2\pi m/2r)\varepsilon_1 + \cos(-2\pi m/2r)\varepsilon_2,
\]
and the vectors $\alpha_m$ can be taken as a root system for $G(r, r, 2)$. With $h$ as in (3.3) and $k_s, k_\ell \in \mathbb{C}$,
\[
\langle \varepsilon_1, h \rangle = \sum_{0 \leq k < r/2} \left( k_s \sin(-2k \pi/2r) t_{\xi_1^{2k} \xi_2^{-2k} (1, 2)} + k_\ell \sin(-(2k + 1) \pi/2r) t_{\xi_1^{2k+1} \xi_2^{-(2k+1)} (1, 2)} \right),
\]
\[
\langle \varepsilon_2, h \rangle = \sum_{0 \leq k < r/2} \left( k_s \cos(-2k \pi/2r) t_{\xi_1^{2k} \xi_2^{-2k} (1, 2)} + k_\ell \cos(-(2k + 1) \pi/2r) t_{\xi_1^{2k+1} \xi_2^{-(2k+1)} (1, 2)} \right).
\]
(4.11)

If $f \in CG(r, r, 2)$, denote the coefficient of $t_g$ in $f$. With notation as in 4.10, let $A$ be the graded Hecke algebra for $G(r, r, 2)$ with
\[
\beta_k = a_{\xi_1^k \xi_2^{-k}}(\varepsilon_1, \varepsilon_2) = [(\varepsilon_1, h), (\varepsilon_2, h)]_{\xi_1^k \xi_2^{-k}} = \begin{cases} \sin(k \pi/2r) k_s k_\ell & \text{if } k \text{ is odd} \\ \sin(k \pi/2r) \frac{k_s^2 + k_\ell^2}{2} & \text{if } k \text{ is even}. \end{cases} \quad (4.12)
\]

If $\bar{\varepsilon}_i = \varepsilon_i - \langle \varepsilon_i, h \rangle$, then by Theorem 3.5, the $\bar{\varepsilon}_i$ commute and the algebra $A$ is the algebra $H_{gr}$ for $I_2(r)$ defined in Section 3.

When $r$ is odd, all aspects of the calculation in (4.11) and (4.12) are the same as for the case $r$ even except that there is only one conjugacy class of reflections, $\{\xi_1^k \xi_2^{-k} (1, 2) \mid 0 \leq k \leq r - 1\}$, and so $k_s = k_\ell$.

4E. The group $G(r, r/2, 2)$, $r/2$ odd

We use the notation from Section 2B, or from above for the group $G(r, r, 2)$. In this case, the group is not a real reflection group, hence $G(r, r/2, 2)$ acts by unitary matrices but not by orthogonal matrices.

Let $A$ be a graded Hecke algebra for $G(r, r/2, 2)$. The only conjugacy class for which $a_g$ can be nonzero is $\{t_{\xi_1^k \xi_2^{-k}} (1, 2) \mid 0 \leq k < r\}$. Thus, in the algebra $A$,
\[
[v_1, v_2] = \beta \sum_k (t_{\xi_1^k \xi_2^{-2k} (1, 2)} - t_{\xi_1^{-2k} \xi_2^{-2k} (1, 2)}), \quad \text{where} \quad \beta = a_{\xi_2^{-2} (1, 2)}(v_1, v_2).
\]
5. A different graded Hecke algebra for $G(r, 1, n)$

The classification of graded Hecke algebras for complex reflection groups in Section 2 shows that there do not exist graded Hecke algebras $A \cong S(V) \otimes CG$ for the groups $G = G(r, 1, n)$, $r > 2$, $n > 3$. In this section, we define a different “semidirect product” of the symmetric algebra $S(V)$ and the group algebra $CG$ for the groups $G(r, 1, n)$. These algebras are not graded Hecke algebras in the sense of Section 1, but they do have a structure similar to what we would expect from experience with graded Hecke algebras for real reflection groups. Is it possible that there is a general definition of graded Hecke algebras, different from that given in Section 1, which includes the algebras defined below as examples for the groups $G(r, 1, n)$?

We shall use the notation for the groups $G(r, 1, n)$ as in Section 2B so that the group $G(r, 1, n)$ is acting by monomial matrices on a vector space $V$ of dimension $n$ with orthonormal basis \{\$v_1, \ldots, v_n\$. Let $s_i$ denote the permutation $(i, i + 1) \in G(r, 1, n)$.

Define $H^*_{r, 1, n}$ to be the algebra generated by the group algebra $CG(r, 1, n)$ and $V$ with relations

\[
\begin{align*}
v_i v_j - v_j v_i & \quad \text{for all } 1 \leq i, j \leq n, \\
t_{\xi_i} v_j = v_j t_{\xi_i} & \quad \text{for all } 1 \leq i, j \leq n, \\
t_{s_i} v_k = v_k t_{s_i} & \quad \text{if } k \notin \{i, i + 1\}, \\
t_{s_i} v_i v_{i+1} = v_i t_{s_i} + \sum_{\ell=0}^{r-1} t_{\xi_{i}^\ell} t_{\xi_{i+1}^{-\ell}}, & \quad \text{for } 1 \leq i \leq n - 1.
\end{align*}
\]

The following proposition establishes an “evaluation homomorphism” for the algebras $H^*_{r, 1, n}$ which is a generalization of the homomorphism in (4.5).

**Proposition 5.2.** Define elements $\bar{v}_k$ in the group algebra $CG(r, 1, n)$ by setting $\bar{v}_1 = 0$ and

\[
\bar{v}_k = \frac{1}{r} \sum_{i<k} \sum_{0 \leq \ell \leq r-1} t_{\xi_{i}^\ell\xi_{k}^{-\ell}}(i,k), \quad \text{for } 2 \leq k \leq n.
\]

Then there is a surjective algebra homomorphism

\[
\begin{align*}
H^*_{r, 1, n} & \rightarrow CG(r, 1, n) \\
t_g & \mapsto t_g \\
v_k & \mapsto \bar{v}_k
\end{align*}
\]

**Proof.** We must check that the defining relations (5.1) of $H^*_{r, 1, n}$ hold with the $v_k$ replaced by the $\bar{v}_k$.

For each $1 \leq k \leq n$, let

\[
\bar{z}_k = \bar{v}_1 + \cdots + \bar{v}_k = \frac{1}{r} \sum_{1 \leq i < j \leq k} t_{\xi_{i}^\ell\xi_{j}^{-\ell}}(i,j),
\]

Then, for each $k$, $\bar{z}_k \in Z(CG(r, 1, k))$ since it is the sum of the elements of the conjugacy class of reflections $t_{\xi_{i}^\ell\xi_{j}^{-\ell}}(i,j)$ in $G(r, 1, k)$. So $\bar{z}_k$ commutes with $\bar{z}_1, \ldots, \bar{z}_k$ and therefore $\bar{z}_1, \ldots, \bar{z}_n$ commute. Since $\bar{v}_k = \bar{z}_k - \bar{z}_{k-1}$, it follows that $\bar{v}_1, \ldots, \bar{v}_n$ also commute.
If \( m > k \) then \( t_{\xi_m} \) clearly commutes with \( \bar{z}_k \). If \( m \leq k \) then \( t_{\xi_m} \) commutes with \( \bar{z}_k \) since \( \bar{z}_k \in Z(G(r,1,k)) \). So \( t_{\xi_m} \) commutes with \( \bar{z}_1, \ldots, \bar{z}_n \) and hence with \( \bar{v}_1, \ldots, \bar{v}_m \).

Since

\[
t_{\bar{v}_k}t_{\bar{v}_h} = t_{\bar{v}_k}\left( \sum_{i \leq k} t_{\xi_i}e_{i+\xi_i}(i,k) \right) t_{\bar{v}_h} = \sum_{i \leq k} t_{\xi_i}t_{\bar{v}_k}t_{\bar{v}_h}t_{\xi_i}(i,k+1)
\]

\[
= \sum_{i \leq k+1} t_{\xi_i}t_{\bar{v}_k+1}(i,k+1) - \sum_{0 \leq i \leq r-1} t_{\xi_i}t_{\bar{v}_k+1}(k,k+1)
\]

\[
= \bar{v}_k+1 - \sum_{0 \leq i \leq r-1} t_{\xi_i}t_{\bar{v}_k+1}t_{\bar{v}_h},
\]

it follows that

\[
\bar{v}_k \bar{v}_h = t_{\bar{v}_k} \bar{v}_k+1 - \sum_{0 \leq i \leq r-1} t_{\bar{v}_k}t_{\xi_i}t_{\bar{v}_h} = t_{\bar{v}_k} \bar{v}_k+1 - \sum_{0 \leq i \leq r-1} t_{\xi_i}t_{\bar{v}_k+1} = t_{\bar{v}_k} \bar{v}_k+1 - \sum_{0 \leq i \leq r-1} t_{\xi_i}t_{\bar{v}_k+1}.
\]
