# Szegő's Theorem as a Variational Principle

Szegő's Theorem was proven by him in 1914 as a statement about Toeplitz Determinants as we discuss below.

In 1920–21, he rephrased it as a variational principle in OPUC. This (two-part) paper essentially invented the general theory of OPUC.

In these papers, Szegő assumed  $d\mu$  was purely a.c. The addition of a singular continuous part is a discovery of Verblunsky in 1934–35 but his work was largely ignored and he didn't get credit until about fifteen years ago when, in a different context, Killip and Simon rediscovered his proof and then his paper.

# Szegő's Theorem as a Variational Principle

This innocuous-looking theorem will have remarkable consequences as we'll see, in part because it has multiple equivalent forms.

Because  $\int f(\theta) \frac{d\theta}{2\pi} < \infty$ , the integral cannot diverge to  $+\infty$ , but it can to  $-\infty$  in which case, we interpret its exponential as 0. Indeed, by Jensen's inequality and the concavity of  $\log$ , the integral is non-positive and the exponential lies in  $[0, 1]$  as it must given that  $\|\Phi_0\| = 1$ .

# Szegő's Theorem and Toeplitz Determinant Asymptotics

Aside: It is known that if  $d\mu_s = 0$  and

$$\log(f(\theta)) \equiv \sum_{n=-\infty}^{\infty} \hat{L}_n e^{in\theta}$$

and

$$\sum_{n=1}^{\infty} n |\hat{L}_n|^2 < \infty$$

then

$$\log D_N(\mu) = (N + 1)\hat{L}_0 + \sum_{n=1}^{\infty} n |\hat{L}_n|^2 + o(1)$$

This is the Strong Szegő Theorem. [OPUC1], Chap. 6 has many proofs of this.

# Upper Bound

One can also get a variational upper bound to complete the proof. The idea is to consider the function

$$D(z) = \exp \left( \int \frac{e^{i\theta} + z}{e^{i\theta} - z} \log(f(\theta)) \frac{d\theta}{4\pi} \right)$$

Formally, and we'll see later that  $D$  is actually in  $H^2(\mathbb{D})$  and has boundary values,  $D(e^{i\theta}) = \lim_{r \rightarrow \infty} D(re^{i\theta})$  exists for a.e.  $\theta$  and

# The end of the proof

Let  $\mu$  have Verblunsky coefficients,  $\{\alpha_n\}_{n=0}^{\infty}$ . Let  $\mu_n$  be the Bernstein–Szegő approximation.

We've proven above that

$$Sz(\mu_n) = \prod_{j=0}^{n-1} \rho_j^2$$

By weak usc

$$Sz(\mu) \geq \overline{\lim} Sz(\mu_n) = \prod_{j=0}^{\infty} \rho_j^2$$

which is the other inequality that we needed to prove.
