Generalized geometric theories and set-generated classes

Peter Aczel, Hajime Ishihara, Takako Nemoto and Yasushi Sangu

March 27, 2012

Abstract

We introduce infinitary propositional theories over a set and their models which are subsets of the set, and define a generalized geometric theory as an infinitary propositional theory of a special form. The main result is that the class of models of a generalized geometric theory is set-generated. Here a class $\mathcal{X}$ of subsets of a set is set-generated if there exists a subset $G$ of $\mathcal{X}$ such that for each $\alpha \in \mathcal{X}$ and finitely enumerable subset $\tau$ of $\alpha$ there exists a subset $\beta \in G$ such that $\tau \subseteq \beta \subseteq \alpha$.

We show the main result in the constructive Zermelo-Fraenkel set theory (CZF) with an additional axiom, called the set generation axiom which is derivable in CZF, both from the relativized dependent choice scheme and from a regular extension axiom. We give some applications of the main result to algebra, topology and formal topology.

Keywords: constructive mathematics, constructive set theory, infinitary propositional theory, generalized geometric theory, set-generated class, relativized dependent choice, regular extension axiom.

1 Introduction

The late Errett Bishop [9] developed his mathematics, Bishop’s constructive mathematics, not based on the principles of classical logic such as the principle of excluded middle, but based on the principles of intuitionistic logic which is weaker than classical logic; see [25, Chapter 1] for some history
of constructive mathematics, and see [9, 10, 11, 18, 12] for the practice in Bishop’s constructive mathematics.

After the publication of Bishop’s book, Myhill [19] developed a constructive set theory as a set theoretical foundation for Bishop’s constructive mathematics, and Martin-Löf [17] developed a predicative type theory, the Martin-Löf type theory, as a foundational approach to Bishop’s constructive mathematics. Aczel [1, 2, 3] introduced a constructive set theory, the constructive Zermelo-Fraenkel set theory (CZF), which has a quite natural interpretation into the Martin-Löf type theory, and hence it is a predicative theory without the power set axiom and the full separation axiom.

When developing mathematics in a predicative way, say in CZF, we are always faced with a difficulty in constructing an object as a set. Sometimes, we are able to find, case by case, constructions of objects as sets; see [13] for a construction of an order completion, [8] for a construction of a completion of a uniform space and [14] and its references for a construction of the set of continuous morphisms from a compact regular formal topology into a completely regular and set-presented formal topology and so on; see [22, 23, 24] for formal topology. However, in general, we have to introduce some notion of an approximation, and deal with a class whose elements can be approximated by elements of a subset of the class.

Aczel [4] introduced the notion of a set-generated dcpo using some terminology from domain theory. A partially ordered class is a directed complete partial order (dcpo) if each directed subset has a least upper bound, where a subset is directed if any pair of elements of the subset has an upper bound in the subset. A dcpo \( X \) is set-generated if there is a subset \( G \) of \( X \) such that, for each \( a \in X \), \( \{ x \in G \mid x \leq a \} \) is a directed subset whose least upper bound is \( a \).

If we restrict our attention to a class \( X \) of subsets of a set with the inclusion \( \subseteq \) as a partial order, then we may say that \( X \) is set-generated if there exists a subset \( G \), called a generating subset, of \( X \) such that

\[
\forall \alpha \in X \forall \tau \in \text{Fin}(\alpha) \exists \beta \in G[\tau \subseteq \beta \subseteq \alpha],
\]

where \( \text{Fin}(\alpha) \) is the set of finitely enumerable subsets of \( \alpha \). As the reader has seen in the literature, say [21, 4] for the class of formal points of a set-presented formal topology, [16] and [20] for constructions of a quotient topology and a coequalizer in formal topology, and will see in Section 7, the notion of a set-generated class in this sense has played crucial roles in
predicative constructive mathematics; see [7] for non-deterministic definitions and set-generated classes.

In this paper, after reviewing the predicative constructive set theory (CZF), we introduce infinitary propositional theories over a set $S$ and their models which are subsets of $S$, and then introduce a generalized geometric theory and their rank. Our main result is the following.

**The class of models of a generalized geometric theory of rank $n$ is set-generated.**

This will be proved by showing that (1) each theory of rank $n + 1$ has a strongly conservative extension of rank $\max\{1, n\}$ (Proposition 4.3), (2) if the class of models of a strongly conservative extension of a theory is set-generated, then the class of models of the theory is set-generated (Proposition 4.4), and (3) the class of models of a theory of rank 1 is set-generated (in Theorem 4.5). We will prove (3) in CZF with an additional axiom, called the set generated axiom (SGA):

**SGA:** For each set $S$ and each subset $Z$ of $\text{Fin}(S) \times \text{Pow}(\text{Pow}(S))$, the class

$$\mathcal{M}(Z) = \{ \alpha \in \text{Pow}(S) \mid \forall (\sigma, \Gamma) \in Z[\sigma \subseteq \alpha \Rightarrow \exists U \in \Gamma (U \subseteq \alpha)] \}$$

is set-generated.

We will show, in CZF, that the axiom SGA both follows from the relativized dependent choice (RDC) in Section 5 and also from a regular extension axiom (RRS$_2$-uREA) in Section 6, respectively. Finally, in Section 7, we will give some applications of the main result to algebra, topology and formal topology including some constructions mentioned above; see [15] for applications in the categories of basic pairs and concrete spaces introduced by Sambin [23, 24].

# 2 The constructive set theory CZF

The constructive set theory CZF, founded by Aczel [1, 2, 3], grew out of Myhill’s constructive set theory [19] as a formal system for Bishop’s constructive mathematics, and permits a quite natural interpretation in Martin-Löf type theory [17].

**Definition 2.1.** The language of CZF contains variables for sets, a constant $\mathbb{N}$, and the binary predicates $=$ and $\in$. The axioms and rules are those of
intuitionistic predicate logic with equality, and the following set theoretic axioms:

1. **Extensionality:** \( \forall a \forall b ( \forall x ( x \in a \iff x \in b ) \implies a = b ) \).

2. **Pairing:** \( \forall a \forall b \exists c \forall x ( x \in c \iff x = a \lor x = b ) \).

3. **Union:** \( \forall a \exists b \forall x ( x \in b \iff \exists y ( x \in a \land y \in b ) ) \).

4. **Restricted Separation:**
   \( \forall a \exists b \forall x ( x \in b \iff x \in a \land \varphi(x) ) \)
   for every restricted formula \( \varphi(x) \). Here a formula \( \varphi(x) \) is restricted, or \( \Delta_0 \), if all the quantifiers occurring in it are bounded, i.e. of the form \( \forall x \in c \) or \( \exists x \in c \).

5. **Strong Collection:**
   \( \forall a ( \forall x \in a \exists y \varphi(x,y) \implies \exists b ( \forall x \in a \exists y \in b \varphi(x,y) \land \forall y \in b \exists x \in a \varphi(x,y) ) ) \)
   for every formula \( \varphi(x,y) \).

6. **Subset Collection:**
   \( \forall a \forall b \exists c \forall u ( \forall x \in a \exists y b \varphi(x,y,u) \implies \exists d ( \forall x \in a \exists y \in d \varphi(x,y,u) \land \forall y \in d \exists x \in a \varphi(x,y,u) ) ) \)
   for every formula \( \varphi(x,y,u) \).

7. **Infinity:**
   \begin{align*}
   (N1) \quad & 0 \in \mathbb{N} \land \forall x ( x \in \mathbb{N} \implies x + 1 \in \mathbb{N} ), \\
   (N2) \quad & \forall y ( 0 \in y \land \forall x ( x \in y \implies x + 1 \in y ) \implies \mathbb{N} \subseteq y ),
   \end{align*}
   where \( x + 1 \) is \( x \cup \{ x \} \), and \( 0 \) is the empty set \( \emptyset = \{ x \in \mathbb{N} \mid \bot \} \).

8. **\( \in \)-Induction:**
   \( (\text{IND}_\in) \quad \forall a ( \forall x \in a \varphi(x) \implies \varphi(a) ) \implies \forall a \varphi(a) \)
   for every formula \( \varphi(a) \).
Let $a$ and $b$ be sets. Using Strong Collection, the cartesian product $a \times b$ of $a$ and $b$ consisting of the ordered pairs $(x, y) = \{\{x\}, \{x, y\}\}$ with $x \in a$ and $y \in b$ can be introduced in CZF. A relation $r$ between $a$ and $b$ is a subset of $a \times b$. A relation $r \subseteq a \times b$ is total (or is a multivalued function) if for every $x \in a$ there exists $y \in b$ such that $(x, y) \in r$. The class of total relations between $a$ and $b$ is denoted by $\text{mv}(a, b)$, or more formally

$$r \in \text{mv}(a, b) \iff r \subseteq a \times b \land \forall x \in a \exists y \in b((x, y) \in r).$$

A function from $a$ to $b$ is a total relation $f \subseteq a \times b$ such that for every $x \in a$ there is exactly one $y \in b$ with $(x, y) \in f$. The class of functions from $a$ to $b$ is denoted by $b^a$, or more formally

$$f \in b^a \iff f \in \text{mv}(a, b) \land \forall x \in a \forall y, z \in b((x, y) \in f \land (x, z) \in f \Rightarrow y = z).$$

In CZF, we can prove

**Fullness:** $\forall a \forall b \exists c(c \subseteq \text{mv}(a, b) \land \forall r \in \text{mv}(a, b) \exists r_0 \in c(r_0 \subseteq r))$,

and, as a corollary, we see that $b^a$ forms a set, that is

**Exponentiation:** $\forall a \forall b \exists c \forall f(f \in c \iff f \in b^a)$.

An inductive definition is a class $\Phi$ of ordered pairs. If $\Phi$ is an inductive definition and $(X, a) \in \Phi$, then we write $X/a \in \Phi$, and call $X/a$ an (inference) step of $\Phi$. A class $\mathcal{Y}$ is $\Phi$-closed if $X \subseteq \mathcal{Y}$ implies $a \in \mathcal{Y}$ for each step $X/a$ of $\Phi$. We will use the following result [2, 6] for the axiom system CZF; see [6] for more details of CZF.

**Theorem 2.2** (Class Inductive Definition Theorem). For each inductive definition $\Phi$, there is a smallest $\Phi$-closed class $\mathcal{I}(\Phi)$.

We say that the class $\mathcal{I}(\Phi)$ is inductively defined by the inductive definition $\Phi$.

In the following, capital and small letters $A, B, \ldots$ and $a, b, \ldots$ will denote sets, and calligraphic letters $\mathcal{A}, \mathcal{B}, \ldots$ will denote classes unless stated otherwise.
3 Infinitary propositional theories

Definition 3.1. The class of $S$-formulae is defined inductively by the following clauses.

1. $p_s$ is an $S$-formula for each $s \in S$;

2. if $\varphi$ and $\psi$ are $S$-formulae, then $(\varphi \rightarrow \psi)$ is an $S$-formula;

3. if $U$ is a set of $S$-formulae, then $\bigwedge U$ and $\bigvee U$ are $S$-formulae.

If $I$ is a set and $\varphi_i$ is an $S$-formula for each $i \in I$, then we write

$$\bigwedge_{i \in I} \varphi_i \equiv \bigwedge \{ \varphi_i \mid i \in I \}$$
and

$$\bigvee_{i \in I} \varphi_i \equiv \bigvee \{ \varphi_i \mid i \in I \}.$$

We denote the class of $S$-formulae by $\mathcal{F}_S$, and let $\mathcal{F}_S^0 = \{ p_s \mid s \in S \}$. We call a subset $T$ of $\mathcal{F}_S$ an $S$-theory.

Remark 3.2. Note that the class $\mathcal{F}_S$ is inductively defined by the steps: $\emptyset/p_s\ (s \in S)$, $\{ \varphi, \psi \}/(\varphi \rightarrow \psi)$, $U/\bigwedge U$ and $U/\bigvee U$ ($U$ is a set). To represent this class in constructive set theory it is necessary to use some coding. For example we can let $p_s \equiv (0, s), (\varphi \rightarrow \psi) \equiv (1, (\varphi, \psi)), \bigwedge U \equiv (2, U)$ and $\bigvee U \equiv (3, U)$.

Let $0 = \emptyset, 1 = \{0\}$ and $\Omega = \text{Pow}(1)$. For each formula $\varphi$ of CZF, define the subclass $\langle \varphi \rangle$ of 1 by $\langle \varphi \rangle = \{ x \in 1 \mid \varphi \}$, where the variable $x$ is chosen not to be free in $\varphi$. For each class $A$ let $!A \equiv (0 \in A)$. Note that $\varphi \iff !\langle \varphi \rangle$, and if $\varphi$ is a restricted formula, then $\langle \varphi \rangle \in \Omega$. 

6
Proposition 3.3. For each $\alpha \in \text{Pow}(S)$ there is a unique class function $\llbracket - \rrbracket_\alpha : \mathcal{F}^S \rightarrow \Omega$ such that for $s \in S$, $\varphi, \psi \in \mathcal{F}^S$ and $U \in \text{Pow}(\mathcal{F}^S)$,

1. $\llbracket p_s \rrbracket_\alpha = \langle s \in \alpha \rangle$,
2. $\llbracket \varphi \rightarrow \psi \rrbracket_\alpha = \langle \forall \varphi \exists ! \psi \rangle$,
3. $\llbracket \bigwedge U \rrbracket_\alpha = \langle \forall \varphi \exists ! \varphi \rangle$,
4. $\llbracket \bigvee U \rrbracket_\alpha = \langle \exists \varphi \exists ! \varphi \rangle$.

Proof. Let $\Phi_\alpha$ be the inductive definition having the following steps, for $s \in S$, $\varphi, \psi \in \mathcal{F}^S$, $U \in \text{Pow}(\mathcal{F}^S)$ and $F : U \rightarrow \Omega$.

1. $\emptyset/(p_s, \langle s \in \alpha \rangle)$,
2. $\{(\varphi, a), (\psi, b)\}/(\varphi \rightarrow \psi, \langle a \rightarrow !b \rangle)$,
3. $F/\bigwedge U, \langle \forall \varphi \exists ! \varphi \rangle$,
4. $F/\bigvee U, \langle \exists \varphi \exists ! \varphi \rangle$.

Note that $F = \{(\varphi, F(\varphi)) | \varphi \in U\}$ since the class $\mathcal{F}^S \times \Omega$ is $\Phi_\alpha$-closed, the class $\mathcal{I}(\Phi_\alpha)$ is a subclass of $\mathcal{F}^S \times \Omega$. Moreover, since it is straightforward to see that the class $\{\varphi | \exists ! a \in \Omega((\varphi, a) \in \mathcal{I}(\Phi_\alpha))\}$ is closed under the inductive definition for $\mathcal{F}^S$ in Remark 3.2, the class $\mathcal{I}(\Phi_\alpha)$ is the graph of the required function $\llbracket - \rrbracket_\alpha : \mathcal{F}^S \rightarrow \Omega$.

Definition 3.4. For $\alpha \in \text{Pow}(S)$ and $\varphi \in \mathcal{F}^S$ let

$$\alpha \models \varphi \iff \exists ! \varphi^\alpha.$$

Proposition 3.5. For $\alpha \in \text{Pow}(S)$, $s \in S$, $\varphi, \psi \in \mathcal{F}^S$ and $U \in \text{Pow}(\mathcal{F}^S)$,

1. $\alpha \models p_s$ iff $s \in \alpha$,
2. $\alpha \models (\varphi \rightarrow \psi)$ iff $\alpha \models \varphi$ implies $\alpha \models \psi$,
3. $\alpha \models \bigwedge U$ iff $\alpha \models \varphi$ for all $\varphi \in U$,
4. $\alpha \models \bigvee U$ iff $\alpha \models \varphi$ for some $\varphi \in U$.

Proof. Routine.

If $T$ is an $S$-theory then, for each $\alpha \in \text{Pow}(S)$ let $\alpha \models T$ iff $\alpha \models \varphi$ for all $\varphi \in T$ and let $\mathcal{M}(T) \equiv \{\alpha \in \text{Pow}(S) | \alpha \models T\}$. 
Definition 3.6. Let \( \iota : S \to S' \). Then there is a unique class function \((-)^\iota : \mathcal{F}^S \to \mathcal{F}^{S'} \) such that, for \( s \in S, \varphi, \psi \in \mathcal{F}^S \) and \( U \in \text{Pow}(\mathcal{F}^S) \),

1. \( p^\iota_s \equiv p_{\iota(s)} \);
2. \((\varphi \to \psi)^\iota \equiv (\varphi^\iota \to \psi^\iota)\);
3. \((\bigwedge U)^\iota \equiv \bigwedge U^\iota\);
4. \((\bigvee U)^\iota \equiv \bigvee U^\iota\),

where \( U^\iota = \{ \varphi^\iota \mid \varphi \in U \} \).

Proof. As in the proof of Proposition 3.3. \( \square \)

Proposition 3.7. Let \( \iota : S \to S', \alpha' \in \text{Pow}(S) \) and \( \alpha \equiv \iota^{-1}(\alpha') \). Then

\[
\alpha \models \varphi \iff \alpha' \models \varphi^\iota
\]

for each \( \varphi \in \mathcal{F}^S \), and hence

\[
\alpha \models T \iff \alpha' \models T^\iota
\]

for each \( S \)-theory \( T \).

Proof. Let \( [-]_{\alpha} : \mathcal{F}^S \to \Omega \) and \( [-]_{\alpha'} : \mathcal{F}^{S'} \to \Omega \) be class functions defined as in the proof of Proposition 3.3. Then the class

\[
\{ \varphi \in \mathcal{F}^S \mid \alpha \models \varphi \iff \alpha' \models \varphi^\iota \}
\]

is closed under the inductive definition for \( \mathcal{F}^S \) in Remark 3.2. \( \square \)

Let \( T \) be an \( S \)-theory and let \( \varphi \) be an \( S \)-formula. Then we write \( T \models \varphi \) if \( \alpha \models \varphi \) for each \( \alpha \in \mathcal{M}(T) \).

Definition 3.8. Let \( \iota : S \to S' \).

1. An \( S' \)-theory \( T' \) is an \( \iota \)-extension of \( T \) if \( T \models \varphi \) implies \( T' \models \varphi^\iota \) for each \( \varphi \in \mathcal{F}^S \).

2. An \( \iota \)-extension \( T' \) of \( T \) is a conservative \( \iota \)-extension if \( T' \models \varphi^\iota \) implies \( T \models \varphi \) for each \( \varphi \in \mathcal{F}^S \), and it is a strongly conservative \( \iota \)-extension if for each \( \alpha \in \mathcal{M}(T) \) there exists \( \alpha' \in \mathcal{M}(T') \) such that \( \alpha = \iota^{-1}(\alpha') \).
Note that if $T'$ is a strongly conservative $\iota$-extension of $T$, then it is a conservative $\iota$-extension, by Proposition 3.7.

**Proposition 3.9.** Let $\iota : S \rightarrow S'$ and let $T$ and $T'$ be an $S$-theory and $S'$-theory, respectively. Then the following are equivalent.

1. $T'$ is an $\iota$-extension of $T$;
2. $T' \models \varphi'$ for each $\varphi \in T$;
3. $\iota^{-1}(\alpha') \in \mathcal{M}(T)$ for each $\alpha' \in \mathcal{M}(T')$.

**Proof.** (1) $\Rightarrow$ (2): Suppose that $T'$ is an $\iota$-extension of $T$. If $\varphi \in T$, then $T \models \varphi$, and hence $T' \models \varphi'$.

(2) $\Rightarrow$ (3): Suppose that $\alpha' \in \mathcal{M}(T')$. Then $\alpha' \models \varphi'$ for each $\varphi \in T$, by (2), and hence $\iota^{-1}(\alpha') \models \varphi$, by Proposition 3.7. Therefore $\iota^{-1}(\alpha') \in \mathcal{M}(T)$.

(3) $\Rightarrow$ (1): Suppose that $T \models \varphi$ and $\alpha' \in \mathcal{M}(T')$. Then $\iota^{-1}(\alpha') \in \mathcal{M}(T)$, by (3), and hence $\iota^{-1}(\alpha') \models \varphi$. Therefore $\alpha \models \varphi'$, by Proposition 3.7. Thus $T' \models \varphi'$.

\[\square\]

### 4 Generalized geometric theories

Let $\sigma$ be a finitely enumerable subset of $\mathcal{F}^S_0$, and let $\Gamma$ be a set of $S$-theories. Then define

$$\sigma \rightarrow \Gamma \equiv (\bigwedge \sigma \rightarrow \bigvee_{U \in \Gamma} \bigwedge U).$$

Note that $\alpha \models (\sigma \rightarrow \Gamma)$ if and only if $\alpha \models \sigma$ implies $\alpha \models U$ for some $U \in \Gamma$.

For a subclass $\mathcal{C}$ of $\mathcal{F}^S$, let

$$\Delta^S_0(\mathcal{C}) = \{ \sigma \rightarrow \Gamma \mid \sigma \in \text{Fin}(\mathcal{F}^S_0), \Gamma \in \text{Pow}(\text{Pow}(\mathcal{C})) \}$$

and let

$$\Delta^S(\mathcal{C}) = (\mathcal{F}^S_0 \cap \mathcal{C}) \cup \Delta^S_0(\mathcal{C}).$$

**Definition 4.1.** For $t \in S$ and $\varphi \in \Delta^S(\mathcal{F}^S)$ let

$$(t \sqsupseteq \varphi) \equiv (\sigma_\varphi \cup \{ p_t \} \rightarrow \Gamma_\varphi).$$

where $\sigma_\varphi$ and $\Gamma_\varphi$ are defined as follows. If $\varphi \equiv p_s \in \mathcal{F}^S_0$ then $\sigma_\varphi \equiv \emptyset$ and $\Gamma_\varphi \equiv \{ \{ p_s \} \}$ and if $\varphi = (\sigma \rightarrow \Gamma) \in \Delta^S_0(\mathcal{F}^S)$ then $\sigma_\varphi \equiv \sigma$ and $\Gamma_\varphi \equiv \Gamma$.
Lemma 4.2. Let $C$ be a subclass of $F^S$ and let $t \in S$. If $\varphi \in \Delta^S(C)$ then $(t \sqsubseteq \varphi) \in \Delta_0^S(C)$ such that, for $\alpha \in \text{Pow}(S)$,

$$\alpha \models (t \sqsubseteq \varphi) \iff t \in \alpha \implies \alpha \models \varphi.$$  

Proof. Let $\varphi \in \Delta^S(C)$. Then, as $\Gamma \varphi \in \text{Pow}(\text{Pow}(C))$,

$$(t \sqsubseteq \varphi) \equiv (\sigma_\varphi \cup \{p_t\} \to \Gamma_\varphi) \in \Delta_0^S(C).$$

Note that when $\varphi \in F^S \cap C$ then

$$\alpha \models (\sigma_\varphi \to \Gamma_\varphi) \iff \alpha \models (\emptyset \to \{\varphi\}) \iff \alpha \models \varphi.$$  

So, for $\varphi \in \Delta^S(C)$,

$$\alpha \models (t \sqsubseteq \varphi) \iff \alpha \models (\sigma_\varphi \cup \{p_t\}) \implies \alpha \models U \text{ for some } U \in \Gamma_\varphi$$

$$\alpha \models p_t \implies \alpha \models (\sigma_\varphi \to \Gamma_\varphi)$$

$$\text{iff } t \in \alpha \implies \alpha \models \varphi.$$  

For $n \in \mathbb{N}$, define a class $G_n^S$ by

$$G_n^S = F_n^S;\quad G_{n+1}^S = \Delta^S(G_n^S).$$

It is straightforward to see that $F_0^S$ is a subclass of each $G_n^S$ so that, for each $n$, $G_{n+1}^S = F_n^S \cup \Delta_n^S(G_n^S)$ and $G_n^S$ is a subclass of $G_{n+1}^S$. An $S$-theory $T$ is a generalized geometric theory of rank $n$ over $S$ if $T \subseteq G_n^S$ for some $n \in \mathbb{N}$.

Theorem 4.3. Let $T$ be a generalized geometric theory of rank $n + 1$ over a set $S$. Then there exists a set $S'$, a mapping $\iota : S \to S'$, and a generalized geometric theory $T'$ of rank $n' = \max\{1, n\}$ over $S'$ which is a strongly conservative $\iota$-extension of $T$.

Proof. Let $T$ be an $S$-theory with $T \subseteq G_{n+1}^S$. Then $T = P \cup Q$ with $P \subseteq F_n^S \cap G_n^S$ and $Q \subseteq \Delta_n^S(G_n^S)$. Let $Q' = \{(\varphi, U, \theta) \mid \varphi \in Q, U \in \Gamma_\varphi, \theta \in U\}$, and, if $q \in Q'$, let $q = (\varphi_q, U_q, \theta_q)$. Let $S' = S + Q' = (\{0\} \times S) \cup (\{1\} \times Q')$, and define $\iota : S \to S'$ by $\iota(s) = (0, s)$ for $s \in S$. Let $Q^* = \{(1, q) \sqsubseteq \theta_q \mid q \in Q'\} \subseteq G_{n'}^S$, and let

$$\tilde{Q} = \{\sigma_\varphi \to \Gamma_\varphi \mid \varphi \in Q\} \subseteq G_1^{S'}.$$

10
Here, for $\varphi \in \Gamma,$

$$\Gamma_\varphi = \{ U_\varphi \mid U \in \Gamma_\varphi \} \in \text{Pow}(\text{Pow}(\mathcal{F}_0^S)),$$

where, for $U \in \Gamma_\varphi,$ $U_\varphi = \{ p(1, (\varphi, U, \theta)) \mid \theta \in U \} \in \text{Pow}(\mathcal{F}_0^S).$ Finally, define a generalized geometric theory $T'$ over $S'$ of rank $n'$ by

$$T' = P^* \cup Q^* \cup \widetilde{Q}.$$ 

Then we shall show that $T'$ is a strongly conservative $\iota$-extension of $T.$

First, we show that $T'$ is an $\iota$-extension of $T$ using Proposition 3.9; i.e. we show that if $\alpha' \in \text{Pow}(S')$ such that $\alpha' \models T'$ and $\alpha \equiv \iota^{-1}(\alpha')$ then

$$\alpha' \models T' \implies \alpha \models T.$$ 

So let $\alpha' \models T'$; i.e. (i) $\alpha' \models P^*$, (ii) $\alpha' \models Q^*$ and (iii) $\alpha' \models \widetilde{Q}.$

We have $\alpha \models P$, by (i) and Proposition 3.7. So it only remains to show that $\alpha \models Q.$ If $\varphi = (\sigma_\varphi \rightarrow \Gamma_\varphi) \in Q$ and $\alpha \models \sigma_\varphi$ we must show that $\alpha \models U$ for some $U \in \Gamma_\varphi.$ Since $\alpha' \models \sigma_\varphi$, by (iii),

$$\alpha' \models \sigma_\varphi \rightarrow \Gamma_\varphi,$$

so that there exists $U \in \Gamma_\varphi$ such that $\alpha' \models U_\varphi.$

We must show that $\alpha \models U$. So let $\theta \in U.$ Then, since $q = (\varphi, V, \theta) \in Q'$ and $p(1, q) \in U_\varphi$, we have $\alpha' \models p(1, q)$, and hence $(1, q) \in \alpha'.$ Since $(1, q) \models \theta^\varphi \in Q^*$, we have $\alpha' \models (1, q) \models \theta^\varphi$, by (ii), and hence $\alpha' \models \theta^\varphi$, by Lemma 4.2, and so $\alpha \models \theta$ by Proposition 3.7. Thus we have $\alpha \models U.$ So we have shown that $T'$ is an $\iota$-extension of $T.$

Next, we show that $T'$ is a strongly conservative $\iota$-extension of $T$. To this end, let $\alpha \in \text{Pow}(S)$ such that $\alpha \models T.$ Define a subset $\alpha'$ of $S'$ by

$$\alpha' = \alpha + \{ q \in Q' \mid \alpha \models \theta_q \}.$$ 

We show that $\alpha' \models T'.$ Clearly $\alpha = \iota^{-1}(\alpha')$, and, since $\alpha \models P$, we have $\alpha' \models P^*$, by Proposition 3.7. Let $q \in Q'.$ If $(1, q) \in \alpha'$, then $\alpha \models \theta_q$, and hence $\alpha' \models \theta_q^\varphi$, by Proposition 3.7. Therefore $\alpha' \models (1, q) \models \theta_q^\varphi$, by Lemma 4.2. Thus $\alpha' \models Q^*.$ Let $\varphi \in Q$ and suppose that $\alpha' \models \sigma_\varphi^\varphi.$ Then $\alpha \models \sigma_\varphi$, and, since $\alpha \models \varphi$, there exists $U \in \Gamma_\varphi$ such that $\alpha \models U.$ Therefore $\alpha' \models U_\varphi,$ and so

$$\alpha' \models \sigma_\varphi \rightarrow \Gamma_\varphi.$$ 

Thus $\alpha' \models \widetilde{Q}.$ As $T' \equiv P^* \cup Q^* \cup \widetilde{Q}$ we are done. \qed
Proposition 4.4. Let $\iota : S \to S'$, and let $T$ and $T'$ be generalized geometric theories over $S$ and $S'$, respectively, such that $T'$ is a strongly conservative $\iota$-extension of $T$. If the class $\mathcal{M}(T')$ is set-generated, then the class $\mathcal{M}(T)$ is set-generated.

Proof. Suppose that $\mathcal{M}(T')$ is set-generated. Then there exists a generating subset $G$ of $\mathcal{M}(T')$. Let $H = \{\iota^{-1}(\alpha') \mid \alpha' \in G\}$. Then for each $\alpha \in \mathcal{M}(T)$ there exists $\alpha' \in \mathcal{M}(T')$ such that $\alpha = \iota^{-1}(\alpha')$. Hence for each $\tau \in \text{Fin}(\alpha)$, since $\iota(\tau) \subseteq \beta'$ for each $\beta' \in G$, there exists $H = \{\iota^{-1}(\beta') \subseteq \iota^{-1}(\alpha') = \alpha\}$. Thus $H$ is a generating subset of $\mathcal{M}(T)$.

Theorem 4.5. Assume SGA. Then the class $\mathcal{M}(T)$ of models of a generalized geometric theory $T$ of rank $n$ is set-generated.

Proof. It is enough to show that the class of models of a generalized geometric theory of rank 1 is set-generated, by Theorem 4.3 and Proposition 4.4. Let $T$ be a generalized geometric theory over a set $S$ of rank 1. Then, since $\alpha \models p_s$ if and only if $\alpha \models \emptyset \to \{p_s\}$ for each $\alpha \in \text{Pow}(S)$, we may assume without loss of generality that $T \subseteq \Delta^S_0(F^S_0)$. For each $\varphi \equiv \sigma_\varphi \to \Gamma_\varphi \subseteq T$, let $\sigma = \{s \in S \mid p_s \in \sigma_\varphi\}$, and let $\Gamma = \{s \in S \mid p_s \in U \mid U \in \Gamma_\varphi\}$. Then we have $\mathcal{M}(Z) = \mathcal{M}(T)$, and hence $\mathcal{M}(T)$ is set-generated, by SGA.

In the following two sections, we will show that SGA can be proved in CZF + RDC, where RDC is the relativized dependent choice, and can also be proved in CZF + RRS$_2$-uREA, where RRS$_2$-uREA is a regular extension axiom.

5 The relativized dependent choice

The relativized dependent choice is stated as follows.

RDC: If $\forall x \in A \exists y \in A((x, y) \in R)$ and $b_0 \in A$, then there exists a function $f : N \to A$ such that $f(0) = b_0$ and $\forall n \in N((f(n), f(n + 1)) \in R)$,

where $A$ is a class and $R$ is a class relation. Note that RDC clearly implies the dependent choice:

DC: If $\forall x \in A \exists y \in A((x, y) \in R)$ and $b_0 \in A$, then there exists a function $f : N \to A$ such that $f(0) = b_0$ and $\forall n \in N((f(n), f(n + 1)) \in R)$,

12
where \( A \) is a set and \( R \) is a class relation.

In this section, we will give a proof of the following theorem.

**Theorem 5.1.** RDC implies SGA.

Before proving the theorem, we show the following small lemma which will be used in the proof.

**Lemma 5.2.** Let \( a, b \) and \( R \) be sets, and let

\[
\begin{align*}
r & \in \text{mv}_R(a, b) \iff r \in \text{mv}(a, b) \land r \subseteq R, \\
\text{Full}_R(a, b, c) & \iff c \subseteq \text{mv}_R(a, b) \land \forall r \in \text{mv}_R(a, b) \exists r_0 \in c(r_0 \subseteq r).
\end{align*}
\]

Then there exists a set \( c \) such that \( \text{Full}_R(a, b, c) \).

**Proof.** By Fullness, there exists a set \( d \) such that \( d \subseteq \text{mv}(a, b) \) and \( \forall r \in \text{mv}(a, b) \exists r_0 \in d(r_0 \subseteq r) \). Let \( c = \{ r \in d \mid r \subseteq R \} \), by Restricted Separation. Then \( c \subseteq \text{mv}_R(a, b) \). For each \( r \in \text{mv}_R(a, b) \), since \( r \in \text{mv}(a, b) \), there exists \( r_0 \in d \) such that \( r_0 \subseteq r \), and therefore, since \( r_0 \subseteq r \subseteq R \), we have \( r_0 \in c \). \( \square \)

Let \( S \) be a set, and let \( Z \) be a subset of \( \text{Fin}(S) \times \text{Pow}(\text{Pow}(S)) \). For \( \alpha \in \text{Pow}(S) \), let \( Z_\alpha = \{(\sigma, \Gamma) \in Z \mid \sigma \subseteq \alpha \} \).

Let \( b = \bigcup_{(\sigma, \Gamma) \in Z} \Gamma \), let \( R = \{(\sigma, \Gamma, U) \in Z \times b \mid U \in \Gamma \} \), and define a class \( \mathcal{V} \) by

\[
\mathcal{V} = \{ (\alpha, c) \mid \alpha \in \text{Pow}(S) \land \text{Full}_R(Z_\alpha, b, c) \}.
\]

**Proposition 5.3.** There exists a set \( V \subseteq \mathcal{V} \) such that

1. \( \forall \tau \in \text{Fin}(S) \exists c((\tau, c) \in V) \),
2. \( \forall (\alpha, c) \in V \forall r \in c \exists (\alpha', c') \in V (\alpha \cup \bigcup \text{ran}(r) = \alpha') \).

**Proof.** Let \( R \) be a class relation defined by

\[
(X, Y) \in R \iff \forall (\alpha, c) \in X \forall r \in c \exists (\alpha', c') \in Y (\alpha \cup \bigcup \text{ran}(r) = \alpha').
\]

We show that \( \forall X \in \text{Pow}(\mathcal{V}) \exists Y \in \text{Pow}(\mathcal{V})((X, Y) \in R) \). To this end, suppose that \( X \) is a set with \( X \subseteq \mathcal{V} \). Then for each \( (\alpha, c) \in X \) and \( r \in c \), letting \( \alpha' = \alpha \cup \bigcup \text{ran}(r) \) and constructing a set \( c' \) such that \( \text{Full}_R(Z_{\alpha'}, b, c') \), by Lemma 5.2, we have \( (\alpha', c') \in \mathcal{V} \). Therefore

\[
\forall ((\alpha, c), r) \in \sum_{(\alpha, c) \in X} c \exists (\alpha', c') \in \mathcal{V} (\alpha \cup \bigcup \text{ran}(r) = \alpha'),
\]

13
and hence there exists a set $Y \subseteq V$ such that

$$\forall ((\alpha, c), r) \in \sum_{(\alpha, c) \in X} c(\alpha', c') \in Y (\alpha \cup \bigcup \text{ran}(r) = \alpha'),$$

by Strong Collection. Clearly, we have $(X, Y) \in \mathcal{R}$.

Since $\forall \tau \in \text{Fin}(S) \exists \text{Full}_R(Z, b, c)$, by Lemma 5.2, there exists a set $X_0 \subseteq V$ such that $\forall \tau \in \text{Fin}(S) \exists (\tau, c) \in X_0$ by Strong Collection. Applying RDC to $\forall X \in \text{Pow}(V) \exists Y \in \text{Pow}(V)((X, Y) \in \mathcal{R})$ and $X_0$, we have a function $f : \mathbb{N} \to \text{Pow}(V)$ such that $f(0) = X_0$ and

$$\forall n \in \mathbb{N}[(f(n), f(n + 1)) \in \mathcal{R}].$$

Let $V = \bigcup_{n \in \mathbb{N}} f(n)$. Then it is straightforward to see (1) and (2).

Using Exponentiation, Restricted Separation and Strong Collection, define sets $B$ and $G$ by

$$B = \{(\alpha_n, c_n)_{n \in \mathbb{N}} \in V^\mathbb{N} \mid \forall n \in \mathbb{N} \exists r \in c_n (P \cup \alpha_n \cup \bigcup \text{ran}(r) = \alpha_{n+1})\},$$

$$G = \{\bigcup_{n \in \mathbb{N}} \alpha_n \mid (\alpha_n, c_n)_{n \in \mathbb{N}} \in B\}.$$

**Proposition 5.4.** $G$ is a subset of $\mathcal{M}(Z)$.

**Proof.** Let $\alpha \in G$. Then there exists $((\alpha_n, c_n))_{n \in \mathbb{N}} \in B$ such that $\alpha = \bigcup_{n \in \mathbb{N}} \alpha_n$. Suppose that $(\sigma, \Gamma) \in Z$ and $\sigma \subseteq \alpha$. Then, since $\sigma \in \text{Fin}(S)$ and $\alpha_n \subseteq \alpha_{n+1}$ for each $n \in \mathbb{N}$, there exist $m \in \mathbb{N}$ and $r \in c_m$ such that $\sigma \subseteq \alpha_m$ and $\alpha_m \cup \bigcup \text{ran}(r) = \alpha_{m+1}$. Therefore, since $r \in \text{mv}_R(Z, \alpha_m)$ and $((\sigma, \Gamma)) \in Z$, there exists $U \in \mathbb{N}$ such that $U \in \Gamma$, and hence $U \subseteq \bigcup \text{ran}(r) \subseteq \alpha_{m+1} \subseteq \alpha$. Thus $\alpha \in \mathcal{M}(Z)$.

**Proposition 5.5.** Let $\gamma \in \mathcal{M}(Z)$, and let $\tau \in \text{Fin}(\gamma)$. Then there exists $\beta \in G$ such that $\tau \subseteq \beta \subseteq \gamma$.

**Proof.** Let $V_\gamma = \{((\alpha, c)) \in V \mid \alpha \subseteq \gamma\}$. We show that

$$\forall (\alpha, c) \in V_\gamma \exists (\alpha', c') \in V_\gamma \exists r_0 \in c (\alpha \cup \bigcup \text{ran}(r_0) = \alpha').$$

To this end, suppose that $(\alpha, c) \in V_\gamma$. Define a set

$$r = \{((\sigma, \Gamma), U) \in Z \times b \mid U \in \Gamma \land U \subseteq \gamma\},$$

14
by Restricted Separation. Then, since $Z_\alpha \subseteq Z_\gamma$ and $\gamma$ is a model of $T$, for each $(\sigma, \Gamma) \in Z_\alpha$ there exists $U \in \Gamma_\phi$ such that $U \subseteq \gamma$. Therefore $r \in \text{mv}_R(Z_\alpha, b)$, and so there exists $r_0 \in c$ such that $r_0 \subseteq r$. Note that $\bigcup \text{ran}(r_0) \subseteq \bigcup \text{ran}(r) \subseteq \gamma$. Then there exists $(\alpha', c') \in V$ such that $\alpha' = \alpha \cup \bigcup \text{ran}(r_0) \subseteq \gamma$, by Proposition 5.3 (2). Thus $(\alpha', c') \in V_\gamma$.

By Proposition 5.3 (1), there exists $c$ such that $(\tau, c) \in V_\gamma$. Applying DC, we have a function $h : n \mapsto (\alpha_n, c_n)$ with domain $\mathbb{N}$ and range $V_\gamma$ such that $(\alpha_0, c_0) = (\tau, c)$ and $\forall n \in \mathbb{N} \exists r_0 \in c_n (\alpha_n \cup \bigcup \text{ran}(r_0) = \alpha_{n+1})$. Therefore, since $h \in B$, we have $\beta = \bigcup_{n \in \mathbb{N}} \alpha_n \in G$ and $\tau \subseteq \beta \subseteq \gamma$. 

Remark 5.6. We can prove Proposition 5.3 using the relation reflection scheme (RRS) of Aczel [5] which is weaker than RDC.

RRS: For a class $A$ and a class relation $R$ such that $\forall x \in A \exists y \in A ((x, y) \in R)$, if $A$ is a subset of $A$, then there is a subset $B$ of $A$ such that $A \subseteq B$ and $\forall x \in B \exists y \in B ((x, y) \in R)$.

However, in the proof of Proposition 5.5, we have invoked the dependent choice (DC) which, together with RRS, implies RDC; see [5, Theorem 2.4].

6 A regular extension axiom

A set $A$ is regular if it is transitive, i.e. $a \subseteq A$ for each $a \in A$, and for each $a \in A$ and $R \in \text{mv}(a, A)$ there exists $b \in A$ such that

$$\forall x \in a \exists y \in b ((x, y) \in R) \land \forall y \in b \exists x \in a ((x, y) \in R).$$

A set $A$ is union-closed if $\bigcup a \in A$ for each $a \in A$.

The union-closed regular extension axiom is stated as follows.

uREA: Every set is a subset of a union-closed regular set.

A regular set $A$ is RRS$_2$-regular if for each $A' \subseteq A$ and $R \in \text{mv}(A' \times A', A')$, if $a_0 \in A'$, then there exists $A_0 \in A$ such that $a_0 \in A_0 \subseteq A'$ and $\forall x, y \in A_0 \exists z \in A_0 ((x, y), z) \in R$.

We will use the following strong form of the union-closed regular extension axiom to prove our result.

RRS$_2$-uREA: Every set is a subset of a union-closed RRS$_2$-regular set.
Proposition 6.1. uREA and DC imply RRS$_2$-uREA.

Proof. Let $S$ be a set. Then, by uREA, there exists a union-closed regular set $A$ such that $\{N\} \cup S \subseteq A$. Note that $a \times a \in A$ for each $a \in A$. We show that $A$ is RRS$_2$-regular. Suppose that $A' \subseteq A$ and $R \in \text{mv}(A' \times A', A')$. Let $A_A = \{a \in A \mid a \subseteq A'\}$, and let $a \in A_A$. Then $\forall(x, y) \in a \times a \exists z \in A(z \in A' \land ((x, y), z) \in R)$, and therefore, since $a \times a \in A$ and $A$ is regular, there exists $b \in A$ such that

$$\forall(x, y) \in a \times a \exists z \in b(z \in A' \land ((x, y), z) \in R)$$

and

$$\forall z \exists b \exists(x, y) \in a \times a(z \in A' \land ((x, y), z) \in R).$$

Since $2 \in A$, $a, b \in A$, and $A$ is regular and union closed, we have $c = a \cup b \in A$, and so $c \in A_A$. Hence

$$\forall a \in A_A \forall c \in A_A[a \subseteq c \land \forall(x, y) \in a \times a \exists z \in c((x, y), z) \in R].$$

Let $a_0 \in A'$. Then $\{a_0\} \in A$, and hence $\{a_0\} \in A_A$. Therefore, by DC, there exists a function $f : N \to A_{A'}$ such that $f(0) = \{a_0\}$, and $f(n) \subseteq f(n + 1)$ and $\forall(x, y) \in f(n) \times f(n) \exists z \in f(n + 1)((x, y), z) \in R$ for each $n \in N$. Letting $A_0 = \bigcup\{f(n) \mid n \in N\}$, since $A$ is regular and union closed, we have $a_0 \in A_0 \in A$. If $x, y \in A_0$, then there exists $n \in N$ such that $x, y \in f(n)$, and hence there exists $z \in f(n + 1) \subseteq A_0$. Therefore $A_0$ satisfies the desired condition.

In the following, we will give a proof of the following theorem.

Theorem 6.2. RRS$_2$-uREA implies SGA.

Let $S$ be a set, and let $Z$ be a subset of $\text{Fin}(S) \times \text{Pow}(\text{Pow}(S))$. For $\alpha \in \text{Pow}(S)$, let $Z_\alpha = \{(\sigma, \Gamma) \in Z \mid \sigma \subseteq \alpha\}$, and note that, since $\sigma \in \text{Fin}(S)$ for each $(\sigma, \Gamma) \in Z$, we have $Z_\alpha = \bigcup_{\tau \in \text{Fin}(\alpha)} Z_\tau$. Let $A$ be a union-closed RRS$_2$-regular set containing $\{N, S\} \cup \{Z_\tau \mid \tau \in \text{Fin}(S)\} \cup \{\Gamma \mid (\sigma, \Gamma) \in Z\}$, and let

$$G = \{\alpha \in A \mid \alpha \in \text{Pow}(S), \alpha \in \mathcal{M}(Z)\}.$$ 

Then $G$ is a set by Restricted Separation.

Proposition 6.3. Let $\gamma \in \mathcal{M}(Z)$, and let $\tau \in \text{Fin}(\gamma)$. Then there exists $\beta \in G$ such that $\tau \subseteq \beta \subseteq \gamma$. 

16
Proof. Let $A_\gamma = \{ \alpha \in A \mid \alpha \subseteq \gamma \}$, and define a binary relation $R$ on $A_\gamma$ by

$$R = \{ (\alpha, \alpha') \mid \forall (\sigma, \Gamma) \in Z_\alpha \exists U \in \Gamma (U \subseteq \alpha', \alpha \subseteq \alpha') \}.$$ 

Let $\alpha \in A_\gamma$. Then $\text{Fin}(\alpha) \subseteq A$, by [4, Lemma 49], and

$$\forall \tau \in \text{Fin}(\alpha) \exists y \in A(y = Z_\tau).$$

Since $A$ is regular, there exists $C \in A$ such that

$$\forall \tau \in \text{Fin}(\alpha) \exists y \in C(y = Z_\tau) \land \forall y \in C \exists \tau \in \text{Fin}(\alpha)(y = Z_\tau).$$

Since $C = \{ Z_\tau \mid \tau \in \text{Fin}(\alpha) \}$ and $A$ is union-closed, we have $Z_\alpha = \bigcup C \in A$, and therefore, since $Z_\alpha \subseteq Z_\gamma$ and $\gamma \in \mathcal{M}(Z)$, we have

$$\forall (\sigma, \Gamma) \in Z_\alpha \exists U \in A(U \in \Gamma \land U \subseteq \gamma).$$

Since $A$ is regular, there exists $D \in A$ such that

$$\forall (\sigma, \Gamma) \in Z_\alpha \exists U \in D(U \in \Gamma \land U \subseteq \gamma) \land \forall U \in D \exists (\sigma, \Gamma) \in Z_\alpha (U \in \Gamma \land U \subseteq \gamma).$$

Therefore, since $A$ is union-closed, we have $\delta = \bigcup D \in A$, and, since $\{ \alpha, \delta \} \subseteq A$ and $A$ is union-closed, we have $\alpha' = \alpha \cup \delta \in A$. Hence we have $\alpha' \in A_\gamma$ and $(\alpha, \alpha') \in R$. Thus $R$ is a total binary relation on $A_\gamma \subseteq A$.

Define a relation $R'$ between $A_\gamma \times A_\gamma$ and $A_\gamma$ by

$$R' = \{ ((\alpha, \alpha'), \eta) \mid (\alpha \cup \alpha', \eta) \in R \}.$$ 

Then for each $\alpha, \alpha' \in A_\gamma$, since $\{ \alpha, \alpha' \} \subseteq A$ and $A$ is union-closed, we have $\alpha \cup \alpha' \in A$, and hence $\alpha \cup \alpha' \in A_\gamma$. Since $R$ is a total relation on $A_\gamma$, we have $R' \in \text{mv}(A_\gamma \times A_\gamma, A_\gamma)$. Let $\tau \in \text{Fin}(\gamma)$. Then, since $\tau \in \text{Fin}(S)$, we have $\tau \in A_\gamma$, and hence $\tau \in A_\gamma$. Therefore by RRS$_2$-uREA, there exists $A_0 \in A$ such that $\tau \in A_0 \subseteq A_\gamma$, and $\forall \alpha, \alpha' \in A_0 \exists \eta \in A_0 (((\alpha, \alpha'), \eta) \in R')$. Letting $\beta = \bigcup A_0$, since $A$ is union-closed, we have $\tau \subseteq \beta \in A$. Assume that $(\sigma, \Gamma) \in Z$ and $\gamma \subseteq \beta$. Then, since $\sigma \in \text{Fin}(\beta)$, there exists $\alpha \in A_0$ such that $\sigma \subseteq \alpha$, and hence there exists $\alpha' \in A_0$ such that

$$\forall (\sigma', \Gamma') \in Z_\alpha \exists U \in \Gamma'(U \subseteq \alpha').$$

Therefore, since $(\sigma, \Gamma) \in Z_\alpha$, there exists $U \in \Gamma$ such that $U \subseteq \alpha' \subseteq \beta$. Thus $\beta \in \mathcal{M}(Z)$, and so $\beta \in G$. 

\end{proof}
7 Applications

In this section, we will give some applications of the results in the previous sections to algebra, topology and formal topology. Before giving these applications, we show the following property of a set-generated class.

Proposition 7.1. Let $\mathcal{X}$ be a class of inhabited subsets of a set $S$, and let $\text{Min}(\mathcal{X})$ be a class of minimal elements of $\mathcal{X}$, that is, $\text{Min}(\mathcal{X}) = \{x \in \mathcal{X} \mid \forall y \in \mathcal{X}(y \subseteq x \Rightarrow y = x)\}$. If $\mathcal{X}$ is set-generated, then $\text{Min}(\mathcal{X})$ is a set.

Proof. Let $G$ be a generating subset of $\mathcal{X}$. Assume that $x \in \text{Min}(\mathcal{X})$. Then, since $x$ is inhabited, there exists $s \in S$ such that $s \in x$, and therefore there exists $z \in G$ such that $\{s\} \in z \subseteq x$. Since $x$ is minimal elements of $\mathcal{X}$, we have $x = z \in G$. Thus $\text{Min}(\mathcal{X}) \subseteq \text{Min}(G)$. Conversely, assume that $x \in \text{Min}(G)$. Then for each $y \in \mathcal{X}$ with $y \subseteq x$, since there is $s \in S$ with $s \in y$, there exists $z \in G$ such that $\{s\} \in z \subseteq y \subseteq x$, and hence $z = y = x$, and hence $x \in \text{Min}(\mathcal{X})$. Therefore $\text{Min}(G) \subseteq \text{Min}(\mathcal{X})$. Clearly, $\text{Min}(\mathcal{X}) = \text{Min}(G)$ is a set, by Restricted Separation.

7.1 Algebra and topology

Let $(R, +, \cdot, 0, 1)$ be a commutative ring. Then a subset $p$ of $R$ is a prime ideal if

1. $0 \in p$;
2. $a, b \in p \Rightarrow a - b \in p$;
3. $a \in R, b \in p \Rightarrow a \cdot b \in p$;
4. $a \cdot b \in p \Rightarrow a \in p \lor b \in p$;
5. $1 \notin p$.

Proposition 7.2. Assume SGA. Then the class of prime ideals of a commutative ring is set-generated.

Proof. Let $(R, +, \cdot, 0, 1)$ be a commutative ring. Then a subset of $R$ is a prime ideal if and only if it is a model of the following generalized geometric theory over $R$ of rank 1:

\[
\{p_0\} \cup \{\bigwedge \{p_a, p_b \mid a, b \in R\} \cup \{p_b \rightarrow p_{a-b} \mid a, b \in R\} \\
\cup \{p_{a-b} \rightarrow \bigvee_{x \in \{a,b\}} p_x \mid a, b \in R\} \cup \{\neg p_1\}.\]
Hence the class of prime ideals of \((R, +, \cdot, 0, 1)\) is set-generated, by Theorem 4.5.

**Corollary 7.3.** Assume SGA. Then the class of minimal prime ideals of a commutative ring forms a set.

**Proof.** By Proposition 7.2 and Proposition 7.1.

Similarly, we are able to show that the class of ideals of a commutative ring is set-generated, and the class of minimal non-trivial ideals of a commutative ring forms a set.

A *neighbourhood space* [9] is a pair \((X, \tau)\) consisting of a set \(X\) and a subset \(\tau\) of \(\text{Pow}(X)\) such that

1. \(\forall x \in X \exists U \in \tau(x \in U)\),
2. \(\forall x \in X \forall U, V \in \tau[x \in U \cap V \Rightarrow \exists W \in \tau(x \in W \subseteq U \cap V)]\).

We say that \(\tau\) is an *open base* on \(X\). A subset \(A\) of \(X\) is open if for each \(x \in A\) there exists \(U \in \tau\) such that \(x \in U \subseteq A\). A function \(f\) between neighbourhood spaces \((X, \tau)\) and \((Y, \sigma)\) is continuous if \(f^{-1}(V)\) is open for each \(V \in \sigma\).

Let \(\{(X_i, \tau_i) | i \in I\}\) be a family of neighbourhood spaces, and let \(\{f_i : X_i \to X | i \in I\}\) be a family of functions. Then an open base \(\tau\) on the set \(X\) is final for the family \(\{f_i | i \in I\}\) if for any neighbourhood space \((Y, \sigma)\) and any function \(g : X \to Y\), \(g\) is continuous if and only if \(g \circ f_i : X_i \to Z\) is continuous for each \(i \in I\).

**Proposition 7.4 (Theorem 4.3 of [16]).** Assume SGA. Let \(\{(X_i, \tau_i) | i \in I\}\) be a family of neighbourhood spaces, and let \(\{f_i : X_i \to X | i \in I\}\) be a family of functions. Then there exists a final open base on the set \(X\) for the family \(\{f_i | i \in I\}\).

**Proof.** Note that a subset \(U\) of \(X\) is a final open if and only if \(f_i^{-1}(U)\) is open in \((X_i, \tau_i)\) for each \(i \in I\). Hence a subset of \(X\) is a final open if and only if it is a model of the following generalized geometric theory over \(X\) of rank 1:

\[
\{p_{f_i(x)} \to \bigvee_{V \in \{W \in \tau_i | x \in W\}} \bigwedge_{y \in V} p_{f_i(y)} \mid x \in X_i, i \in I\}.
\]

Therefore the class of final opens on \(X\) is set-generated by Theorem 4.5, and its generating set forms a final open base.
7.2 Formal topology

In this subsection, we will give some applications of our main results in formal topology developed by Sambin [22, 23, 24].

A formal topology \((S, \leq, \triangleleft)\) is a preordered set \((S, \leq)\) equipped with a class relation \(\triangleleft \subseteq S \times \text{Pow}(S)\) such that

1. \(a \in U \Rightarrow a \triangleleft U\);
2. \(a \triangleleft U \land \forall c \in U(c \triangleleft V) \Rightarrow a \triangleleft V\);
3. \(a \triangleleft U \land a \triangleleft V \Rightarrow a \triangleleft \downarrow U \cap \downarrow V\);
4. \(a \leq b \Rightarrow a \triangleleft \{b\}\),

where \(\downarrow U = \{a \in S \mid \exists b \in U(a \leq b)\}\).

A formal topology \((S, \leq, \triangleleft)\) is set-presented if there exists a family of subsets \(C(a, i)\) \((i \in I(a), a \in S)\) of \(S\), called a set-presentation of \((S, \leq, \triangleleft)\), such that

\[a \triangleleft U \iff \exists i \in I(a)(C(a, i) \subseteq U)\].

Let \((S, \leq, \triangleleft)\) be a formal topology. Then a formal point of a formal topology \((S, \leq, \triangleleft)\) is a subset \(\alpha \subseteq S\) such that

1. \(\alpha\) is inhabited;
2. \(a, b \in \alpha \Rightarrow (\downarrow a \cap \downarrow b) \not\subseteq \alpha\);
3. \(a \in \alpha\) and \(a \triangleleft U \Rightarrow U \not\supseteq \alpha\),

where \(\downarrow a = \downarrow \{a\}\) and \(U \not\supseteq V\) stands for \(\exists a(a \in U \land V)\). Note that, if \((S, \leq, \triangleleft)\) is set-presented with a set-presentation \(C(a, i)\) \((i \in I(a), a \in S)\), then the last condition is equivalent to

\[\forall i \in I(a)[a \in \alpha \Rightarrow C(a, i) \not\subseteq \alpha]\].

**Proposition 7.5** (Theorem 4.3 of [21]). Assume SGA. Then the class of formal points of a set-presented formal topology is set-generated.

**Proof.** Let \((S, \leq, \triangleleft)\) be a set-presented formal topology with a set-presentation \(C(a, i)\) \((i \in I(a), a \in S)\). Then a subset of \(S\) is a formal point if and only if it is a model of the following generalized geometric theory over \(S\) of rank 1:

\[
\{\forall a \in S p_a\} \cup \{\bigwedge \{p_a, p_b\} \rightarrow \bigvee_{c \in |a \cap b|} p_c \mid a, b \in S\} \\
\cup \{p_a \rightarrow \bigvee_{b \in C(a, i)} p_b \mid i \in I(a), a \in S\}.
\]

20
Hence the class of formal points of \((S, \leq, \prec)\) is set-generated, by Theorem 4.5.

Corollary 7.6. Assume SGA. Then the class of minimal formal points of a set-presented formal topology forms a set.

A formal topology \((S, \leq, \prec)\) is T1 if \(\alpha \subseteq \beta \Rightarrow \alpha = \beta\) for each formal points \(\alpha\) and \(\beta\).

Corollary 7.7 (Corollary 4.4 of [21]). Assume SGA. Then the class of formal points of a set-presented T1 formal topology is a set.

Proof. By Corollary 7.6.

A continuous morphism from a formal topology \((S, \leq, \prec)\) into a formal topology \((T, \leq', \prec')\) is a relation \(r \subseteq S \times T\) such that

1. \(a r b\) and \(b \prec' V \Rightarrow a \prec r^{-1}(V)\);
2. \(a \prec r^{-1}(T)\);
3. \(a r b\) and \(a r c \Rightarrow a \prec r^{-1}(\downarrow b \cap \downarrow c)\).

Note that, if \((S, \leq, \prec)\) and \((T, \leq', \prec')\) are set-presented with set-presentations \(C(a, i)\) \((i \in I(a), a \in S)\) and \(D(b, j)\) \((j \in J(b), b \in T)\), respectively, then these conditions are respectively equivalent to

1. \(\forall j \in J(b)[a r b \Rightarrow \exists i \in I(a) \forall a' \in C(a, i) \exists b' \in D(b, j)(a' r b')]\);
2. \(\exists i \in I(a) \forall a' \in C(a, i) \exists b \in T(a' r b)\);
3. \(a r b\) and \(a r c \Rightarrow \exists i \in I(a) \forall a' \in C(a, i) \exists d \in \downarrow b \cap \downarrow c(a' r d)\).

Proposition 7.8. Assume SGA. Then the class of continuous morphisms between set-presented formal topologies is set-generated.

Proof. Let \((S, \leq, \prec)\) and \((T, \leq', \prec')\) be set-presented formal topologies with set-presentations \(C(a, i)\) \((i \in I(a), a \in S)\) and \(D(b, j)\) \((j \in J(b), b \in T)\), respectively. Then a subset of \(S \times T\) is a continuous morphism if and only
if it is a model of the following generalized geometric theory over $S \times T$ of rank 2:

\[
\begin{align*}
\{ & p(a,b) \to \bigvee_{i \in I(a)} \bigwedge_{a' \in C(a,i)} \bigvee_{j \in J(b)} p(a',b') \mid j \in J(b), a \in S, b \in T \} \\
\cup & \{ \bigvee_{i \in I(a)} \bigwedge_{a' \in C(a,i)} \bigvee_{b \in T} p(a',b) \mid a \in S \} \\
\cup & \{ \bigwedge \{ p(a,b), p(a,c) \} \to \bigvee_{i \in I(a)} \bigwedge_{a' \in C(a,i)} \bigvee_{d \in [\downarrow b] \cap [\downarrow c]} p(a',d) \mid a \in S, b, c \in T \}. 
\end{align*}
\]

Hence the class of continuous morphisms between $(S, \leq, \triangleleft)$ and $(T, \leq', \triangleleft')$ is set-generated, by Theorem 4.5.

As the final application, we show the following proposition which is the crucial step in the construction, given by Erik Palmgren [20], of coequalizers in the category of set-presented formal topologies; see [15] for applications of our main result in the categories of basic pairs and concrete spaces introduced by Sambin [23, 24].

**Proposition 7.9** (Lemma 2–4 of [20]). Assume SGA. If $r$ and $s$ are continuous morphisms between a set-presented formal topology $(S, \leq, \triangleleft)$ and a formal topology $(T, \leq', \triangleleft')$, then the class $\mathcal{C}$ of subsets of $T$ defined by

\[
\mathcal{C} = \{ U \in \text{Pow}(T) \mid \forall a \in S(a \triangleleft r^{-1}(U) \Leftrightarrow a \triangleleft s^{-1}(U)) \}
\]

is set-generated.

**Proof.** Let $C(a, i) (i \in I(a), a \in S)$ be a set-presentation of $(S, \leq, \triangleleft)$. Then, since

\[
\forall a \in S(a \triangleleft r^{-1}(U) \Rightarrow a \triangleleft s^{-1}(U))
\]

\[
\Leftrightarrow \forall a \in S(a \in r^{-1}(U) \Rightarrow a \triangleleft s^{-1}(U))
\]

\[
\Leftrightarrow \forall b \in T[b \in U \Rightarrow \forall a \in r^{-1}(b) \exists i \in I(a) \forall a' \in C(a, i) \exists b' \in s(a')(b' \in U)],
\]

a subset of $T$ is in the class $\mathcal{C}$ if and only if it is a model of the following generalized geometric theory over $T$ of rank 3:

\[
\begin{align*}
\{ & p_b \to \bigwedge_{a \in r^{-1}(b)} \bigvee_{i \in I(a)} \bigwedge_{a' \in C(a,i)} \bigvee_{b' \in s'(a')} p_{b'} \mid b \in T \} \\
\cup & \{ p_b \to \bigwedge_{a \in s^{-1}(b)} \bigvee_{i \in I(a)} \bigwedge_{a' \in C(a,i)} \bigvee_{b' \in r'(a')} p_{b'} \mid b \in T \}.
\end{align*}
\]

Hence the class $\mathcal{C}$ is set-generated, by Theorem 4.5.

\[22\]
Acknowledgments.

The second author is grateful to Erik Palmgren and Benno van den Berg for discussions on an early draft of this paper during his stay at the Institut Mittag-Leffler in November 2009, and to the Japan Society for the Promotion of Science (Grant-in-Aid for Scientific Research (C) No.19500012 and No.23540130) for partly supporting the research. The first author is grateful to the Cambridge Newton Institute for providing an excellent working environment for his work on the later drafts of this paper, carried out during his stay at the Institute in the period January to March, 2012. The authors wish to thank Peter Schuster for suggesting to them some applications of our main result.
